Preface

This manual describes the troubleshooting procedures and diagnostic commands that you can use to solve basic problems with the MicroVAX™ 3100 Model 85, Model 95, and Model 96 systems.

Audience

This manual is intended for people who have some experience with computers.

Structure of This Manual

This manual presents the information you need for solving basic problems with the MicroVAX 3100 Model 85/95/96 system in one chapter. Use the sections in the order presented, starting with Section 1.1, Troubleshooting, when solving a problem with your system. You can follow up with diagnostic testing or by contacting Digital services for support as described in Section 1.3 and Section 1.4.

Additional Information

See the MicroVAX 3100 Model 85/95/96 Operator Information manual for the list of related documents.
Conventions

The following conventions are used in this manual:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MONOSPACING type</td>
<td>Text displayed on the screen is shown in monospace type.</td>
</tr>
<tr>
<td>italic type</td>
<td>Italic type emphasizes important information and indicates the complete titles of manuals.</td>
</tr>
<tr>
<td>Note</td>
<td>A note contains information that is of special importance to the user.</td>
</tr>
<tr>
<td>Warning</td>
<td>A warning contains information to prevent personal injury.</td>
</tr>
</tbody>
</table>
This chapter describes the troubleshooting procedures and diagnostic commands that you can use to solve basic problems with the MicroVAX 3100 Model 85, Model 95, and Model 96 systems. It contains information on the following:

• Troubleshooting
• Diagnostic tests and commands
• Contacting Digital™ services

It also lists the information that you must give to your Digital services representative and where to find this information.

1.1 Troubleshooting

If a problem occurs, you must first make sure that all the cables, loopback connectors, and terminators are correctly connected and that the connectors are not damaged, for example, the pins may be broken or short-circuited.

Follow these steps:

1. Shut down the operating system by following the procedures described in the operating system documentation.

2. Turn off the console terminal and all the peripheral devices, such as printers and modems.

3. Turn off all the expansion boxes.

4. Turn off the system unit.

5. Check that the following cables, if installed, are correctly connected at both ends and that the connectors are not damaged:
   • Console terminal cable (linking the console terminal to the system unit)
   • Console terminal power cord
• System unit power cord
• Expansion box SCSI cables
• Expansion box power cords
• ThinWire™ Ethernet cable or standard Ethernet cable

6. Check that the following terminators, if installed, are correctly connected and are not damaged:
   • SCSI terminators
   • ThinWire Ethernet terminator (T-connector and two terminators)
   • Standard Ethernet loopback connector

If you have correctly followed steps 1 to 5, the on/off switches on all the components are set to the off (O) position, and you have solved any problems caused by incorrectly connected cables or terminators.

7. Set the on/off switches on the following equipment to the on (|) position in the following order:
   a. Expansion boxes
   b. Peripherals
   c. Console terminal
   d. System unit

The system responds with the power-up test display. If it does not, see Section 1.2.

1.2 Using the Troubleshooting Table

Table 1–1 suggests the corrective actions for certain system problems. If you have a problem with the system, follow these steps:

1. Write down the symptoms of the problem.
2. Check the Symptom column in Table 1–1 for a match.
3. Check the causes of the symptom in the Possible Cause column. If the column lists more than one possible cause, check the possible causes and their suggested solutions in the order listed.
4. Follow the advice in the Suggested Solution column.
5. See Section 1.4 if the problem persists.
<table>

</tr>
<tr>
<td></td>
<td>Drive cables are not properly connected.</td>
<td>Check the cable connections.</td>
</tr>
<tr>
<td>The Configuration display does not show a SCSI device.</td>
<td>SCSI device is not properly terminated.</td>
<td>Check for a SCSI 50-pin terminator.</td>
</tr>
<tr>
<td></td>
<td>Two SCSI identifiers are set to the same number.</td>
<td>Reset each SCSI ID to a unique number.</td>
</tr>
</tbody>
</table>
1.3 Diagnostic Tests and Commands

There are a number of diagnostic tests and commands that can help you to isolate a problem with the system unit. These tests and commands are as follows:

- Power-up tests
- Diagnostic tests and utilities\(^1\)
- Configuration display\(^1\)
- Error display\(^1\)

The following sections describe these tests and commands.

\(^1\) You can use these tests and commands in privileged console mode only if the console security feature is enabled and the password is set. See the MicroVAX 3100 Model 85/95/96 Customer Technical Information manual for information on the console security feature.
1.3.1 Power-Up Tests
The system runs the power-up tests each time you turn on the system. After successful completion of tests, the system will either enter console mode or proceed to automatic bootstrap, depending on the HALT action selected by the user. If HALT action is Default, Halt, or Restart, then the system enters console mode. If HALT action is Reboot or Restart_reboot, then the system proceeds to boot. The following example shows a typical display for a system that passes all tests and then enters console mode.

_________________________ Note _____________________________

The operating system messages start here, that is VMS ...

_________________________

If the power-up tests encounter an error, one of the following actions occurs:

For minor errors:

• If HALT action is set to a boot condition (that is reboot or restart_reboot),
  and if a minor error occurs, the system displays an abbreviated error
  message and continues to boot as normal.

• If HALT action is set to Default, Halt or Restart, then the system enters
  console mode.

• The only errors defined as minor are errors in memory that cause pages
  to be marked bad in the memory bitmap. There must be enough good
  memory left to allow an attempt to bootstrap.

For severe errors:

• The system always enters console mode regardless of HALT action after it
  attempts to complete all tests possible.
The following example shows a system with a memory error that only affected one set of memory out of two sets. Because some memory is still usable, the system proceeds to automatic bootstrap if the HALT action is set to a boot condition.

KA55-A or KA51-A or KA56-A V2.6, VMB 2.15
Performing normal system tests.

1..0..

1 Operating system messages start here; that is VMS ...

2 Abbreviated error message for memory error

Memory errors normally cause the results of a SHOW MEMORY display to occur after the tests are completed and before continuing. SHOW MEMORY is the most useful command to determine which memory SIMMs are bad when memory errors occur.
### 1.3.2 Diagnostic Tests and Utilities

The diagnostic tests and utilities are similar to the power-up tests except that the power-up tests enable you to test all the devices in the system, whereas the diagnostic tests and utilities enable you to test single devices and the functions of single devices.

Figure 1–1 shows a list of diagnostic tests obtained by entering the following command:

```plaintext
>>> T 9E
```

</table>

To run the diagnostic tests, enter either TEST or T followed by the test number.

You can specify optional parameters for some tests, but you would not do so normally. If you decide to specify optional parameters, then the following conditions apply:

- Each test uses up to 10 parameters, no more than 7 may be inputted on a command line.
  - Most of these parameters are assigned values automatically by the system.
  - These parameters are indicated by an asterisk (*) in the parameters column of Figure 1–1.
- If a parameter can be assigned a value, the name of the parameter is shown in the parameters column in Figure 1–1.
You can use test 9E with the test number as a parameter to show a list of legal parameters and valid values for the test number. For example, enter T 9E 30 to show a list of legal parameters and valid values for test number 30 (Memory_Init_Bitmap).

- There is a dependency between some tests.
- Failures can occur if dependencies between tests are not followed.
- Any parameter not entered is given a default value. Enter T 9E nn, where nn is test number to show defaults. During power-up testing or execution of any script of tests (A0 to BF), the values of parameters are determined by the script, not defaults.
- You may dump the contents of a script by entering T 9E nn, where nn is a script to dump. Scripts are always in range of A0 to BF (or 0 for the power-up script).

You must enter three zeros (0) as place holders for the three parameters that occur before the user-specified parameter, mark_hard_SBEs. The last value (1) is a parameter. You can then specify the mark_hard_SBEs parameter in the Memory_Init_Bitmap test as follows:

```plaintext
>>> T 30 0 0 0 1
```

The resulting messages differ, depending on the function of the test or utility. However, most failing tests cause the system to display error messages similar to the following:

```plaintext
>>> T 5F 1

1.3.4 Configuration Display

The configuration display shows the system configuration and the error messages that were detected while the most recent power-up tests, diagnostic tests, and utilities were running. If you add expansion boxes to the system and do not run the power-up tests or appropriate diagnostic test or utility, the configuration display does not recognize the reconfiguration. Enter the following command to see the configuration display:

`>>> SHOW CONFIG`

If the system does not detect any errors in the most recent power-up tests or diagnostic utilities, it responds with a configuration display similar to the following:

```
KA55-A or KA51-A or KA56-A V2.6, VMB 2.15
0B-00-2B-33-CF-C980MB
80MB

<table>
<thead>
<tr>
<th>TstNbr</th>
<th>DevNam</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

<td>DHW41/2 V1.6</td>
</tr>
</tbody>
</table>
```

1. Test Utility Number Column
2. Device Mnemonic Column
3. Device Status Column
4. SCSI IDs and SCSI Device Names

The test numbers listed identify the normal test or script number to run to verify the device listed. There are additional tests and utilities for some devices. Test 0 calls the power-up script.
The lines for F0, E8 and EC display only if the applicable option is present.

If the system detects errors in the most recent power-up tests and diagnostic utilities, it responds with a configuration display similar to the following:

```
KA55-A or KA51-A or KA56-A V2.6, VMB 2.15
08-00-2B-2B-16-91
80MB

<table>

```

Write down this information before you contact your Digital services representative.
1.4 Contacting Digital Services

Warning

Only authorized service personnel should service the MicroVAX 3100 Model 85/95/96.

If you have followed the procedures in this chapter but the problem remains unsolved, your Digital services representative can help you. Before you place your call, follow these steps:

1. Write down a description of the problem, including the error messages and the number of the tests or utilities that failed.

2. Look at the status LED display on the back of the system unit and write down the numbers of the LEDs that are lit (see Figure 1–2).

3. List the steps you took to correct the problem as well and their results.

4. Write down the serial and model numbers of the system unit and any connected peripheral devices. These numbers are usually printed on a label on the back of the device.

How to Order Additional Documentation

Technical Support
If you need help deciding which documentation best meets your needs, call 800-DIGITAL (800-344-4825) and press 2 for technical assistance.

Electronic Orders
If you wish to place an order through your account at the Electronic Store, dial 800-234-1998, using a modem set to 2400- or 9600-baud. You must be using a VT terminal or terminal emulator set at 8 bits, no parity. If you need assistance using the Electronic Store, call 800-DIGITAL (800-344-4825) and ask for an Electronic Store specialist.
