FCC NOTICE: The equipment described in this manual generates, uses, and may emit radio frequency energy. The equipment has been type tested and found to comply with the limits for a Class A computing device pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such radio frequency interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference, in which case the user at his own expense may be required to take measures to correct the interference.

# Adding and Using Expansion Boxes

4.1 Guidelines for Connecting Expansion Boxes ..................... 4-2
4.2 Unpacking an Expansion Box ......................................... 4-4
4.3 Installing a Bottom Dress Cover .................................... 4-6
4.4 Preparing Your System for an Expansion Box ..................... 4-7
4.5 Connecting One Expansion Box ....................................... 4-9
4.6 Daisy-Chaining Multiple Expansion Boxes .......................... 4-12
4.7 Adding the RRD40 Compact Disc Expansion Box .................. 4-14
  4.7.1 Verifying the Voltage Selector Position on the RRD40 ...... 4-15
  4.7.2 Verifying the SCSI ID on the RRD40 ............................ 4-15
  4.7.3 Resetting the SCSI ID on the RRD40 ......................... 4-16
4.8 Adding an RZ55 Hard Disk Expansion Box .......................... 4-16
  4.8.1 Verifying the SCSI ID on the First RZ55 ...................... 4-17
  4.8.2 Resetting the SCSI ID on the Second RZ55 .................... 4-17
4.9 Adding and Using a TK50Z–GA Tape Expansion Box ............. 4-19
  4.9.1 Verifying the SCSI ID on the TK50Z–GA ....................... 4-19
  4.9.2 Inserting a Tape Cartridge ...................................... 4-20
  4.9.3 Removing a Tape Cartridge ...................................... 4-23
  4.9.4 Using TK50Z–GA Controls and Indicator Lights .......... 4-24
5 Connecting to a Network

5.1 Connecting to a ThinWire Ethernet Network ........................................... 5-1
  5.1.1 Verifying the Network Select Button Position ........................................ 5-2
  5.1.2 Verifying ThinWire Ethernet Network Installation .................................... 5-3
  5.1.3 Connecting ThinWire Ethernet Cable ...................................................... 5-5
  5.1.4 Creating a Daisy-Chain Work Group ..................................................... 5-6
  5.1.5 Connecting to a DECconnect Faceplate .................................................. 5-7
  5.1.6 Troubleshooting the ThinWire Ethernet Segment ....................................... 5-8

5.2 Connecting to a Standard Ethernet Network ................................................. 5-11
  5.2.1 Setting the Network Select Button for Standard Ethernet ............................ 5-11
  5.2.2 Verifying Your Standard Ethernet Network Installation ............................. 5-11
  5.2.3 Troubleshooting Standard Ethernet ...................................................... 5-12
  5.2.4 Connecting a Transceiver Cable ............................................................ 5-14
  5.2.5 Creating a Daisy-Chain Work Group ..................................................... 5-15

6 Troubleshooting

6.1 Identifying the Source of a Problem ....................................................... 6-1
6.2 Using the Troubleshooting Table ............................................................. 6-3

7 Running Diagnostics

7.1 Power-Up Messages .................................................................................... 7-2
  7.1.1 Power-Up Error Messages ........................................................................ 7-3

About This Guide

Purpose of This Manual

This manual describes how to install, test, and maintain the hardware components of a VAXstation 3100 Model 48 computer system.

Who Should Use This Manual

This manual is for anyone setting up and using the Model 48 for the first time. It includes information on hardware installation, operation, and maintenance.

Structure of This Manual

This manual contains eight chapters, five appendixes, a glossary of technical terms, and an index.

- Chapter 1 includes an overview of the VAXstation 3100 Model 38 and VAXstation 3100 Model 48 systems, and introduces you to the product features.

- Chapter 2 provides instructions for installing your new Model 48.

- Chapter 3 discusses the software loading devices (TZ30 tape drive and RRD40 compact disc drive) that are an integral part of your system.

- Chapter 4 discusses the add-on storage and software loading devices that can be used with your system.

- Chapter 5 discusses connecting your system to a simple ThinWire daisy-chain work group.
Chapter 6 provides basic system troubleshooting information.

Chapter 7 describes how to run self-tests and system diagnostics.

Chapter 8 lists the options available for your system. It also shows how to connect a printer or modem to your system.

Appendixes provide complementary information on the following topics:

- Appendix A: Customizing your startup procedures
- Appendix B: SCSI ID numbers
- Appendix C: Status and error codes
- Appendix D: Hardware specifications
- Appendix E: Associated documents

The glossary defines technical terms used in this guide.

The index helps you to find the information you need.

Guide to VAXstation 3100 Documentation

The manuals you will use to install, operate, manage, and maintain your VAXstation 3100 Model 48 system are listed below. The left column lists the manuals; the right column contains some of the topics described in each manual. See also Appendix E.

Conventions

The following conventions are used in this manual:

Ctrl/x

A sequence such as Ctrl/x indicates that you must hold down the key labeled Ctrl while you press another key or a pointing device button.

Return

A key name is shown enclosed to indicate that you press a named key on the keyboard.

red ink

Red ink indicates information that you must enter from the keyboard. In the online version of the book, this information is shown in bold type.

bold

Bold type is used to introduce new terms. New terms are defined in the Glossary.

UPPERCASE

Uppercase letters indicate that you must enter a command exactly as shown. For example, enter SHOW.

lowercase

Lowercase letters in commands indicate that you must provide a value. For example, enter SET PASSWORD new_password.

Warning

Warnings contain information to prevent personal injury. Read these carefully.

Caution

Cautions provide information to prevent damage to equipment or software. Read these carefully.

Note

Notes provide general information about the current topic.
Margin Icon Definitions

Throughout this manual, symbols or icons in the margin identify important switches, buttons, connectors, or procedures. These icons are briefly described here. Figure 2–3 shows the locations for many of the ports and switches.

Icons That Signal Procedures

Certain icons act as reminders about important procedures that are being described in the nearby text.

This icon signals that you turn to another guide (for instance, the monitor guide) for more complete instructions on a certain procedure. Then you return to the procedures in this manual.

This representation of an on/off switch shows the off (0) position. This icon signals that you should turn off one or more devices, as described in the nearby text.

The on/off switch is shown in the on (1) position. This icon signals that you should turn on one or more devices, as described in the nearby text.

Icons for Ports, Connectors, and Buttons

This section describes the icons that appear on the bezel for the back of the system unit. The icon for a port or connector appears in the margin to signal that you connect a cable to that port or connector. The icon for a button appears to signal that you press that button. See Figure 2–3 for icon locations on the bezel.

The SCSI icon in the margin signals that you attach a cable or terminator to the SCSI port.

The icon for Ethernet signals a procedure with one of the Ethernet connectors or the network select button.

The halt icon signals that you press the halt button to put the system into console mode.

The keyboard icon identifies the connector where you put the keyboard cable.
The mouse icon identifies the connector where you put the mouse cable (or the tablet cable).

This icon appears on the cable for the mouse (or tablet). You put this cable into the port with the mouse icon.

The monitor icon identifies the connector where you put the monitor cable.

The printer icon identifies the port for the printer cable. This port also supports a hardcopy terminal or an additional video terminal for alternate console mode. See Appendix A.

The communications port is identified by this icon. You put the modem cable here, if you have this option.

The alternate console switch is identified by this icon. Appendix A gives instructions for installing and using an alternate console.

The row of diagnostic lights on the back of the system unit is identified by this icon. Chapter 7 describes how to use these lights.
The VAXstation 3100 Model 48 is a desktop server/workstation that provides the full VMS or ULTRIX operating systems and applications to diskless members of a work group. The VAXstation 3100 Model 48 also functions as a workstation for the owner/local system manager. Figure 1–1 shows the VAXstation 3100 Model 48 system.

Figure 1–1  VAXstation 3100 Model 48 System
1.1 System Highlights

The VAXstation 3100 Model 48 and the Model 38 system units are contained in similar enclosures. The Model 48 enclosure is 14.99 centimeters (5.9 inches) high; the Model 38 enclosure is smaller—10.3 centimeters (4 inches) high.

The Model 48 system unit has many special features, as described in the following list:

- **RRD40 compact disc drive**—The RRD40 compact disc drive built into your system unit is a read-only optical disc device that stores 600 megabytes (or about 200,000 pages) of data. Information is read from a compact disc (CD) using laser technology, which means that your operating system software can be installed rapidly. The compact disc may include operating system software, windowing software, applications, and documentation.

- **Memory**—You can order your system with up to 32 megabytes of memory.

- **TZ30 tape drive**—The built-in TZ30 tape drive stores up to 95 megabytes of data per tape cartridge.

- **ThinWire and standard Ethernet connectivity**—You can connect to either standard Ethernet or ThinWire Ethernet networks.

- **RZ23 disk storage**—One to three RZ23 104-megabyte hard disks serve as your system disk drive and as storage for the diskless users in the work group.

- **RZ24 disk storage**—One to three RZ24 209-megabyte hard disks serve as your system disk drive and as storage for the diskless users in the work group.

- **Add-on storage**—The RZ55 hard disk drive can be purchased in an expansion box to provide you with an extra 332 megabytes of storage.

- **Add-on storage**—Different RZxx-xx hard disk expansion box options are available to provide you with a variety of extra storage configurations.

- **Two operating systems to choose from**—VMS or ULTRIX, which is Digital Equipment Corporation's version of the UNIX operating system. Operating system software is purchased separately from the VAXstation 3100 hardware.
Windowing software—DECwindows software and, optionally, VAX Windowing Software (VWS/UIS), give you a visual way to organize your work in windows. You can run several different applications simultaneously and switch between them. You can use graphic symbols instead of command lines to do your work.

SCSI connectivity—Small Computer System Interface (SCSI) is an industry standard for connecting mass storage devices.

For customers requiring additional security in their VAX console, you can secure your system in the console mode using the password security feature. See Section 7.11 for more information on this feature.

1.2 The VAXstation 3100 Family

The VAXstation 3100 systems can be used in several configurations, from a VAXstation 3100 Model 38 diskless workstation used as a satellite in a work group, to a Model 38 standalone workstation with hard disks, to a VAXstation 3100 Model 48 used as the server for one or more Model 38 workstations.

Your Model 48 system can be used as a standalone workstation, or it can be the server to members of a work group. It can be a networked server if that work group is connected to a larger network.

The Model 38 diskless satellite workstation is the basic, introductory system. It provides the option of working in a small work group or connecting to a network.
Installing System Hardware

After helping you check that you have all your equipment, and the right location for your system, this chapter shows you how to set up your system, including:

- Connecting the keyboard
- Connecting the mouse
- Attaching Ethernet terminators to prepare for either networking or diagnostic tests
- Connecting the monitor
- Connecting the power cords
- Starting your system

The chapter then guides you to getting your system up and running, including:

- What to do if you are planning to connect to a network
- What to do if you are planning to add an expansion box, modem, or printer
- Where to learn about installing your operating system software
2.1 Choosing the Right Location

Use the following checklist to ensure that your VAXstation 3100 Model 48 operates at its best:

- Keep the temperature between 15.5° and 32°C (60° and 90°F).
- Keep the relative humidity between 40% and 80%. Store tape cartridges at this humidity.
- Keep the air well circulated to prevent excess heat and dust from accumulating.
- Keep your equipment away from heaters, photocopiers, direct sunlight, and abrasive particles.
- Select a surface that is large enough to hold a monitor, a system unit, and a keyboard and mouse. Your desk or work table is a good choice. It is important that your system unit be positioned at least three feet away from other operating equipment.
- Place the monitor so that the top line of the monitor display is at eye level.
- Choose a place where bright light will not reflect off the monitor, to eliminate screen glare.
- Keep the area clean. Do not place food or liquid on or near your equipment, and do not place your system unit directly on the floor. Dust and dirt damage system components.
- Keep air vents clear on each side of the system unit for proper ventilation.
- Do not place the system unit on its side. Blocking the air vents can cause the system unit to overheat.
- Connect your system to an isolated grounded circuit. Do not exceed the voltage requirement of the circuit.
- Let equipment warm to room temperature before you turn it on. This avoids the possibility of damaging equipment that has been moved in from the cold. Let tape cartridges stabilize for 24 hours.
- Finally, carefully read and follow all installation instructions before you turn on the power.
2.2 Unpacking

Figure 2–1 shows the basic components of your system. The contents of your shipment may differ from the components shown in Figure 2–1, depending on what you order.

Figure 2–1 Unpacking System Components

Monitor
System Unit
RRD40 Test Disc and Empty CD Caddy
Blank Tape Cartridge
Manuals
Monitor Cable (Color Shown)
Keyboard
Mouse
Power Cords
Ethernet Loopback Connector
Screwdriver
Two Terminators and One T-Connector

MLO-003423
Warning Because of the weight of the system unit and the monitor, two people should lift the equipment out of the boxes and place it on a work surface. Figure 2–2 shows the proper way to lift equipment.

Figure 2–2   Lifting Equipment

Save cartons and packing material. Always repack your equipment in its original packing material when moving your VAXstation 3100 Model 48. This precaution will protect the hard disks from damage.

2.3 Setting Up Your System

You are ready to set up your system unit.

2.3.1 Identifying System Unit Ports and Connectors

Turn the system unit so that the back of it faces you.

Facing the back of the system unit, take a minute to look at all the ports and connectors shown in Figure 2–3. Symbols (called icons) molded on the bezel identify each port and connector you will need to install your system. The icons are defined in the Preface.

The SCSI port on the back of the system unit has a cover that is not shown in Figure 2–3. Leave the SCSI cover on until you are ready to add an expansion box.
Figure 2-3  Ports, Connectors, and Icons

ThinWire Ethernet Light
ThinWire Ethernet Connector
Halt Button
Keyboard Connector
Mouse Connector
Monitor Connector
Printer Port
Communication Port
S3 Alternate Console Switch
Diagnostic Lights

On/Off Switch
Monitor AC Power
System AC Power
2.3.2 Connecting the Keyboard

Connect the free end of the keyboard cable to the keyboard connector on the back of the system unit, as shown in Figure 2-4.

**Caution** Do not connect or disconnect the keyboard while the system is turned on.

Figure 2-4    Connecting the Keyboard to the System Unit

[Diagram showing the connection of the keyboard cable to the system unit]
2.3.3 Connecting the Mouse

Find the mouse cable with its pointing device icon.

**Caution** Do not connect or disconnect the mouse while the system is turned on.

Connect the free end of the mouse cable (with pointing device icon on top) to the mouse connector on the back of the system unit, as shown in Figure 2–5. If you have ordered the optional tablet, connect the tablet to the system unit in the same manner described for connecting a mouse.

*Figure 2–5 Connecting the Mouse to the System Unit*
2.3.4 Attaching Ethernet Terminators

You need to connect the T-connector, with two Ethernet terminators, and the loopback connector to the system unit to successfully complete the power-up tests discussed later in this chapter.

1 Push a terminator into each side of the T-connector and turn both to the right until they lock into place. See Figure 2–6.

Figure 2–6 Connecting Terminators to the T-Connector

Later, if you decide to connect to a network, you exchange ThinWire cable sections for one or both terminators, depending on your network setup. See Chapter 5 for additional information.
2 Next, connect the T-connector to the ThinWire Ethernet connector on the back of the system unit. Turn the ribbed portion of the connector to the right until it locks into place. See Figure 2-7. Make sure the T-connector is set at an angle, as shown in the illustration. This angle allows room for the loopback connector in the next step.

Figure 2-7 Connecting the T-Connector to the System Unit
Connect the loopback connector to the standard Ethernet connector on the back of the system unit, as shown in Figure 2–8. Later, when the system has been turned on, the green light on the connector will come on.

Figure 2–8  Connecting the Loopback Connector to the System Unit

![Diagram of Ethernet Loopback Connector](image-url)
2.3.5 Connecting the Monitor

You can put the monitor to the side of the system unit or on top of it. In order to place your monitor away from the system unit, you need to order an optional long monitor cable. See Chapter 8.

Installation is basically the same for any of the monitors available for your system. With one exception (see step 5), install your monitor according to the instructions in your monitor guide. See your monitor guide for information on these procedures:

- Connecting the monitor cable to the monitor
- Changing the voltage setting to match the voltage source
- Replacing a fuse
- Adjusting brightness and contrast

To set up your monitor:

1. Check your monitor guide for instructions. (There is one exception; see step 7.)

**Caution** Do not connect or disconnect the monitor cable to the system unit while the power is on.

2. The color monitor cable will attach to the monitor using either a thumbscrew, or a universal strain relief strap (USRS). Check to see if there is an attachment point (screw hole) on the back of your monitor where a thumbscrew can be attached. If there is, proceed to step 3. If there is no attachment point, you will need to go to step 5 to attach the monitor cable to the monitor using the universal strain relief strap (Figure 2–9).

3. Select the appropriate thumbscrew for your monitor cable. The color monitor cable comes with two thumbscrews of different lengths, to attach the cable to the monitor. Use the long thumbscrew for large color monitors. Use the short thumbscrew for all other monitors.

4. Push the thumbscrew into the junction block of the monitor cable, and then screw it into the attachment point in the back of the monitor, being careful not to overtighten.
5 Attach the universal strain relief strap to the color monitor cable by following these steps:

- Insert the three BNC connectors and cable junction block of the monitor cable through the center slot of the universal strain relief strap, making sure the strap is **under** the cable junction block.

**Note** The **bottom** side of the cable junction block has the smaller of the two screw holes, and is dimpled. The universal strain relief strap should lie against this side of the cable junction block.

- Pull the monitor cable into the slotted hole at the bottom end of the universal strain relief strap and bring the strap flush with the cable junction box.

- Align the center BNC connector (green) with the two key slots of the closed hole at the top end of the universal strain relief strap, and snap the BNC connector into the hole.

- Follow the instructions in your monitor guide to attach the BNC connectors to the back of the monitor.

Figure 2–9 shows the monitor cable attached to the back of a monitor using the universal strain relief strap.

**Figure 2–9** Connecting the Monitor Cable to the Monitor Using the Universal Strain Relief Strap

![Diagram of connecting monitor cable](image)

- **BNC Connectors**
- **USRS**
- **Cable Junction Block**

MLO-004680
6 Follow the directions in the monitor guide to connect the monitor cable to the monitor.

7 Do not connect the keyboard and mouse to the monitor cable. (You have already connected them to the system unit.)

8 Connect the free end of the monitor cable to the back of the system unit, as shown in Figure 2–10.

Note To order the optional longer monitor cable, see Chapter 8.

9 Tighten the thumbscrews on the monitor connector by turning them to the right.
2.3.6 Connecting the Power Cords

The power cord is an electrical ground for your system. To connect your system to a power source, perform the following steps:

1. Make sure that the monitor and the system unit on/off switches are off (0).

   **caution** While the system unit automatically adjusts itself to the correct voltage, your monitor may not. Refer to your monitor guide when checking the monitor voltage rating.

2. Ensure that your monitor's voltage requirements match the voltage of the AC power outlet you plan to plug the monitor into before proceeding. Monitors require either 110 VAC or 220 VAC.

3. Connect one end of the short power cord to the monitor. Plug the other end of the power cord into the system unit's AC power outlet, as shown in Figure 2–11.

**Figure 2–11** Connecting the Monitor Power Cord
4 Plug one end of the long power cord into the AC power connector on the back of the system unit. Plug the other end into a grounded electrical wall outlet. See Figure 2–12.

**Figure 2–12  Connecting the System Power Cord**

![System Power Cord](image_url)
2.4 Connecting Optional or Expansion Hardware

If optional equipment is included in your order, turn to the following chapters for instructions on connecting the equipment to your system:

- To connect expansion boxes, see Chapter 4.
- To connect a printer, see Chapter 8.
- To connect a modem, see Chapter 8.
- To connect a tablet, see Section 2.3.3.

2.5 Inserting Media

Turn the system unit so that the front of it faces you. To open the front of the Model 48, push and then release the door where the arrow is pointing in Figure 2–13. The internal RRD40 compact disc drive and TZ30 tape drive are visible.

![Opening the Front of the Model 48 System Unit](image)

Insert the RRD40 test disc, included in your initial shipment, in the disk drive. See Section 3.2 for instructions on how to correctly insert a compact disc.
Insert the blank tape cartridge, included in your initial shipment, in the TZ30 tape drive. See Chapter 3 for instructions on how to correctly insert and remove a tape in the TZ30 tape cartridge.

2.6 Starting Your System

Turn your system components on (1), in the order given in the following list.

1. Turn expansion boxes on (1) in the following order:
   - RZ55 hard disk expansion box
   - Other hard disk expansion boxes
   - TK50Z-GA tape expansion box
   - RRD40 compact disc expansion box

2. Turn printers and modems on (1), if you have this equipment.

3. Turn your monitor on (1).
   Leave the monitor on so that it turns on and off with the system unit.

4. Turn the system unit on (1).
   It takes approximately 90 seconds for the first line of the power-up display to appear on the screen. The green light on the front of the monitor should come on.

   This is a good time to adjust the brightness and contrast of your monitor. Your screen looks blank if the brightness and contrast are turned down too low. Follow the directions in your monitor guide to set the brightness and contrast.

2.6.1 Checking the Power-Up Display

When you turn the system unit on, a power-up display appears on the monitor screen.

If you see a display similar to the following example, your system has passed all power-up tests and the keyboard language has been set:

```
KA42-B     V1.2
F...E...D...C...B...A...9...8...7...6...5...4...3...2...1...
? E  0040  0000.0005
? D  0050  0000.0005
OK
```
You may possibly see a display similar to the following:

<table>
<thead>
<tr>
<th>VMS/VMB</th>
<th>ULTRIX</th>
<th>ADDR</th>
<th>DEVTYP</th>
<th>NUMBYTES</th>
<th>RM/FX</th>
<th>WP</th>
<th>DEVNAM</th>
</tr>
</thead>

</tr>
</tbody>
</table>

[ESA0] ? >>>

If you see this display, press [Ctrl/c] to continue; that is, hold down the [Ctrl] key while you press the [c]. If you see a display similar to the first display in this section, your keyboard language has been set. If not, follow the instructions in Section 2.7.

2.6.2 If You Have Problems

If, after following the instructions in the prior section, you do not see the power-up display, turn your system unit off (0) and review each installation step. Repeat the power-up procedure. If you still do not see the power-up display, consult Chapter 6.
2.7 If You Need to Set the Keyboard Language

When you receive your system, the keyboard language should be set for the keyboard you ordered.

However, if the following display (the keyboard language menu) appears after you press [Ctrl/c] in Section 2.6.1, you need to set the keyboard language.

<p>| | |</p>
<table>
<thead>

</tr>
</tbody>
</table>

To set the keyboard language, perform the following steps:

1. Select a language from the keyboard language menu to match the type of keyboard you have.

2. If you want to select the default language (English, which is option 3), press the Return key. Otherwise, enter the number of the language that matches the language of your keyboard, and press the Return key.

   A different keyboard is available for each language. If you do not know the language variation of the keyboard you received, check the packing list.

The language you chose is now saved in memory. If you need to change the keyboard language later, Chapter 6 shows you how.
2.8 Connecting to a Network

If you are connecting your system to a work group (whether or not you are connecting to a larger network), read Chapter 5. You will need to install your network hardware before you install your operating system software.

2.9 Getting Ready to Install Your Operating System Software

To install your VMS or ULTRIX operating system software, you need one of the following:

- TZ30 tape drive
- Connection to a network to load the software from another system
- RRD40 compact disc drive
- TK50Z–GA tape drive

Your Model 48 system is set at the factory to automatically start your operating system software from any device that you specify during the software installation procedure.

Verify that the default recovery (automatic boot) on your system is set to 2. Enter the following command at the console prompt (>>>):

```plaintext
>>> SHOW HALT
2
```  

See Appendix A if you need to change the default recovery to 2.

To install VMS or ULTRIX software on the VAXstation 3100 Model 48, follow the installation instructions that were shipped with the software. During software installation, the software is transferred from the installation medium (tape cartridge or compact disc) to the hard disk in your VAXstation 3100 Model 48 or to an expansion box.

If your software does not load properly, see Chapter 6. The RRD40 test disc that comes with the RRD40 compact disc drive can help you determine the source of the problem.

If your local area VAXcluster is part of a larger network, you may be able to use Remote System Manager (RSM) software on a host system to `down-line load` and install application software.
2.10 Turning Your System Off

If you need to turn your system off, follow the shutdown instructions in your operating system software documentation.

**Note** When you use a VAXstation 3100 Model 48 in a cluster, you should not turn off, halt, or restart the system without notifying work group members. These activities affect the operation of the entire work group.

After completing the system shutdown, turn your equipment off (0) in the following order:

1. Expansion boxes
2. Printer, modem, or other equipment
3. Monitor and system unit
3

Learning About Your System

This chapter provides information about:

- RZ23 and RZ24 hard disks
- RRD40 compact disc drive
- Tape cartridges
- TZ30 tape drive
- Mouse

3.1 Hard Disk Drives

A hard disk stores information on a nonremovable disk. You can have up to three hard disks in your Model 48 system unit. The RZ23 has 104 megabytes of storage, while the RZ24 has 209 megabytes of storage.

RZ23 and RZ24 hard disks are mounted internally in the system unit. Additional disks can only be added if there is available space. To determine the number of disks in your system, enter TEST 50 at the console prompt, then press the Return key. Your system configuration is displayed on the screen. It lists the storage devices mounted in your system. An example configuration display can be found in Section 7.3.

You can increase your system's storage capacity with the RZ55 hard disk expansion box and the RZ5x-xx series of hard disk expansion boxes. See Chapter 4 to learn about expansion boxes.
3.2 Using the RRD40 Compact Disc Drive

Turn the system unit so that the front of it faces you. To open the front of the Model 48, push and then release the door where the arrow is pointing in Figure 3-1.

Figure 3–1  Opening the Front of the Model 48 System Unit

The integral RRD40 compact disc drive and TZ30 tape drive are visible. The front of the RRD40 has an opening for the optical disc and one activity light. The green activity light goes on when you load a compact disc in the drive and flashes when the disc is transferring information.

3.2.1 Loading a Compact Disc

To load a compact disc into the disc drive, insert the entire disc caddy into the disc opening on the drive. Do not remove the compact disc from the caddy.

To load a disc:

1. Examine the disc caddy. Make sure that it is not cracked or damaged in any way. Never load a damaged caddy into a disc drive.
2 Insert the disc caddy as shown in Figure 3–2. The label on the disc should always be facing up when you insert the disc into the drive. Make sure the notches on the left side of the disc caddy line up with the notches on the opening of the drive.

Figure 3–2 Loading a Compact Disc
Note If you have the disc positioned label side up but the notches are on the right, then the disc is oriented improperly in the caddy. Proceed no further with the disc loading. See Section 3.2.4 and Section 3.2.3.

3 Slide the caddy in as far as it will go and then remove the transparent sleeve. The disc and its housing remain in the drive. Only the transparent sleeve comes out. See Figure 3–2.

4 Also note that the green light on the front of the disk drive comes on and stays on.

The green activity light should come on within 5 seconds. If the drive accepted the disc and caddy but the activity light does not come on, the disc may be sitting incorrectly in the caddy. Remove the disc and check to make sure that the label is facing up as you insert the disc into the drive again.

3.2.2 Removing a Compact Disc

Before removing a compact disc, make sure that the green activity light is not flashing. If the light is flashing, the compact disc drive is transferring data. Wait until the green activity light stops flashing. To unload a disc:

1 Position the transparent sleeve as for loading. Make sure the arrow on the sleeve is pointing into the drive opening.

2 Insert the sleeve into the drive opening as far as it will go.

3 Remove the caddy. The disc and housing should be in the sleeve. The green activity light should go out.
3.2.3 Inserting the Compact Disc into the Caddy

A compact disc is contained inside a protective caddy for insertion into the compact disc drive. The caddy consists of three parts: the disc, the housing, and the transparent sleeve, as shown in Figure 3–3.

Figure 3–3 Compact Disc Caddy
To place a compact disc into a caddy, perform the following steps:

1. Hold the disc with your free hand. Position the housing and disc as shown in Figure 3–4 (always work with the disc so the label is facing up, and the four notches on the housing are to the left).

2. Position your thumb on the outer edge of the disc and your index finger in the center hole of the disc.

3. Slip the disc into the housing. The inside of the housing is grooved to accept the disc. Exert inward pressure on the housing to hold the disc in the housing.

---

**Figure 3–4 Inserting Disc in Housing**

---

4. Slide the housing into the transparent sleeve until it clicks into place.

5. Turn the assembled caddy so that the label on the disc is facing up. Make sure that the notches on the housing are on the left. If the notches are not on the left when the disc is label side up, then the disc is mounted inside the caddy incorrectly. Remove the disc from the caddy, turn the disc over, and place it in the caddy in the correct position.
It is important that the disc be correctly mounted in the caddy. The compact disc drive cannot access data from a disc that is incorrectly mounted. If the disc is incorrectly mounted, remove it and remount it in the caddy.

### 3.2.4 Removing the Compact Disc from the Caddy

To remove the disc from the caddy for cleaning or caddy repair, perform the following steps:

1. Hold the caddy so that it is facing label side down. Locate the locking tabs on either side of the disc housing.

2. Press down on both of the locking tabs while slightly separating the housing from the sleeve. Use your fingernails or a sharp, pointed instrument. See Figure 3–5.

#### Figure 3–5  Pressing Locking Tabs

3. When both tabs have been disengaged, pull the disc housing out to about the midpoint of the disc.

4. Hold the disc housing on each side. Exert inward pressure on the housing so the disc will not fall out. Remove the sleeve from the housing. Place the sleeve aside.
5 Hold the disc with your free hand as shown in Figure 3–4. Position your thumb on the outer edge of the disc and your index finger in the center hole of the disc. Release pressure from the housing and remove the disc.

3.2.5 Caring for Compact Discs

Protect a disc from dust, ink, fingerprints, or other contaminants whenever it is not in the caddy.

- Always handle a disc by the outer and inner edges.
- Never touch the data area of the disc (the area covered by the silk-screened label).

When loading a disc, gently insert the disc caddy into the compact disc drive.

To unload a disc, simply insert the transparent sleeve into the compact disc drive.

Compact discs can be cleaned with a dry, lint-free cloth. To clean a disc, wipe from the center of the disc to the edges. Use small circular strokes. Do not use a continuous circular stroke around the disc.

3.3 Using Tape Cartridges

This section shows you how to

- Label a tape cartridge
- Write to and protect tape cartridges
- Handle and store tape cartridges
- Use the TZ30 tape drive
- Insert and remove a tape cartridge
- Understand TZ30 lights

3.3.1 Labeling a Tape Cartridge

The TK50Z–GA and TZ30 tape drives both use TK50–K 95-megabyte (CompacTape) or TK52–K 296-megabyte (CompacTape II) tape cartridges.

Always label tape cartridges. A slot for the label is provided on the front of the cartridge, as shown in Figure 3–6. In this slot, the label is visible when the cartridge is in the drive. Labels or markings on any other part of the cartridge can interfere
with proper operation of the drive. Do not write directly on the cartridge with pen, pencil, or other marking medium.

Figure 3–6  Labeling a Tape Cartridge

3.3.2  Writing to and Protecting Tape Cartridges

Write protecting a tape prevents accidental erasure of information. The VAXstation 3100 Model 48 can read information on the tape regardless of the position of the write-protect switch. However, the VAXstation 3100 Model 48 cannot write data to a write-protected tape.
3.3.2.1 Write Protecting a Tape  When you use a tape to install software, set the write-protect switch on the front of the cartridge to the write-protect position.

To write protect a tape, slide the write-protect switch left toward the label until it locks in place (Figure 3–7). An orange rectangle appears when the write-protect switch locks in the write-protect position.

Figure 3–7  Write Protecting a Tape

If you move the write-protect switch to the right during operation, the software does not recognize that the tape is no longer write-protected. To write-enable the tape, unload the tape Section 3.4.2,
slide the write-protect switch to the right, and begin tape loading procedures again. The software will now recognize the cartridge as write enabled.

Similarly, if you move the write-protect switch to the left during operation, the tape is not write-protected until the current command completes.

3.3.2.2 Writing to a Tape  When you use a tape to make a backup copy or to write out data, set the write-protect switch to enable writing to the tape.

To enable writing, slide the switch to the right, away from the label, until the switch locks in place.

3.3.3 Handling and Storing Tape Cartridges

Take the following precautions when handling and storing tape cartridges:

- Never touch the exposed surface of the tape.
- Avoid dropping the tape cartridge. The impact can cause damage.
- Allow new tape cartridges to come to room temperature before using them.
- Write on the identification label before sliding it into the slot on the tape cartridge. Do not put the label anywhere else on the cartridge.
- Store tape cartridges away from dust in their plastic covers.
- Keep tape cartridges out of direct sunlight, and away from heaters and other heat sources. Store tape cartridges at an even temperature between 10°C and 40°C (50°F and 104°F). Store cartridges where the relative humidity is between 40% and 80%.
- Keep tape cartridges away from magnets and equipment that generates magnetic fields, such as motors, transformers, and video monitors and terminals.
- Keep tape cartridges away from X-ray equipment.
3.4 Using the TZ30 Tape Drive

The TZ30 tape drive holds one removable magnetic tape cartridge. The tape cartridge stores up to 95 megabytes of data. Use the tape cartridge to load software or data or to make copies (or backups) of software or data. Figure 3–8 shows the indicator lights and the unload button.

The TZ30 tape drive can read data from and write data to a tape that was written by a TK50Z–GA tape drive. The TZ30 tape drive, however, cannot read from, or write data to, a tape that has been written by the TK70 tape drive.

**Figure 3–8   TZ30 Lights and Controls**

![TZ30 Lights and Controls Diagram]

3.4.1 Inserting a Tape Cartridge

To learn about tape cartridges, see Section 3.3. To insert a tape cartridge, follow these steps:
1 Make sure the system unit is on (1).

2 Make sure the tape drive lever is to the left in the unlock position. See Figure 3–9.

3 Insert the tape cartridge, as shown in Figure 3–9. The operate-lever light (green) comes on.

**Figure 3–9 Inserting a Tape Cartridge in the TZ30**

4 With the cartridge all the way in, move the lever to the lock position, all the way to the right. The green light goes off and the yellow (tape-in-use) light blinks, indicating that the tape is loading.

When the tape is loaded (ready for use), the yellow light stays on continuously. Whenever the yellow light is on continuously and it is the only light on, the tape is ready to use.

When the tape is being read, written to, or rewound, the yellow light blinks.

**Note** If the write-protect switch on the cartridge is in the write-protect position, the orange write-protect light on the front of the tape drive comes on and you will not be able to write data to the tape.
3.4.2 Removing a Tape Cartridge

To remove a tape cartridge:

1. Press the unload button.
   Wait approximately two minutes for the tape to rewind. The yellow light will flash as the tape rewinds.

2. When the green light comes on, the yellow light goes off, and the beep sounds twice, move the lever to the unlock position (to the left). The cartridge ejects. Remove the cartridge as shown in Figure 3–10.

Caution A tape cartridge must be unloaded and removed from the drive before drive power is turned off. Failure to remove the cartridge can result in damage to both the cartridge and the drive.

Figure 3–10 Removing a Tape Cartridge from the TZ30
3.4.3 Understanding TZ30 Lights

Table 3–1 is a summary of the possible light combinations.

<table>
<thead>
<tr>
<th>Light</th>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green (operate-lever)</td>

<tr>
<td>All three lights</td>
<td>Blinking</td>
<td>Drive fault. See Chapter 6.</td>
</tr>
<tr>
<td></td>
<td>On</td>
<td>Power-up diagnostic test in progress.²</td>
</tr>
</tbody>
</table>

¹Intermittent fast blinking indicates that a write is in progress. Continuous fast blinking indicates that a read is in progress. Medium blinking indicates calibration. Slow blinking indicates that the tape is initializing, loading, unloading, or rewinding. The light blinks slowly for 10 seconds indicating drive initialization on power-up after the power-up diagnostic has run.

²All three lights stay on for a few seconds while the power-up diagnostic test is running. If all three lights stay on for longer than a few seconds, the power-up diagnostic has failed or an error occurred during an operation.

3.4.4 If You Have Problems

If an error occurs when you are reading or writing to a tape, all three lights blink. If an error occurs when you are inserting the tape cartridge, the green light blinks and the tape does not move. In either event, see Table 6–1 for troubleshooting instructions.

3.5 Mouse

You can use the mouse to point to and select objects on the screen after installing windowing software on your system. To learn how to use your mouse, see your windowing documentation.
Adding and Using Expansion Boxes

This chapter provides information about installing and using compact disc, hard disk, and tape expansion boxes. An expansion box is an external box that connects to your system unit to provide additional compact disc, hard disk, or tape storage.

Each expansion box is shipped with the appropriate cables and connectors for connecting more than one box. Cable connections and installation instructions are similar for all three expansion boxes. The following expansion boxes can be used with a VAXstation 3100 system:

- 332-megabyte RZ55 hard disk expansion box
- 95-megabyte TK50Z–GA tape expansion box
- 600-megabyte RRD40 compact disc expansion box
- Various RZ5x-xx storage options

Instructions for the following tasks are included in this chapter:

- Connecting one or more expansion boxes to your system unit
- Verifying the SCSI ID default (factory) switch setting on the first expansion box
- Setting the SCSI switches on a second expansion box
- Adding and using the TK50Z–GA tape expansion box
- Testing your expansion boxes
The **RZ55 hard disk** and the **TK50Z–GA tape drive** provide disk and tape storage for your system. Optionally, the TK50Z–GA can be used to load software.

- The RZ55 and the TK50Z–GA are enclosed in similar expansion boxes.
- If you have more than one RZ55 expansion box, you must reset the external SCSI ID switches on the second RZ55.
- Information on the RZ5x-xx expansion box series is covered in the manual that ships with each individual option. Please refer to that manual for information on adding any one of the RZ5x-xx series of expansion boxes.

The **RRD40 compact disc drive** is a read-only storage device that reads data from removable compact discs. The RRD40 disc drive is an integral device. It is also available in an external expansion box. Chapter 3 describes the integral RRD40 compact disc drive. This chapter discusses the expansion box model.

The RRD40 compact disc expansion box can be used for many purposes. For example, it can be used for application software installation, database storage, and online documentation.

- The RRD40 compact disc expansion box is contained in a smaller expansion box than the RZ55 and the TK50Z–GA.
- Cable connections and installation instructions for the RRD40 compact disc expansion box are similar to those for the RZ55 and TK50Z–GA expansion boxes.
- The RRD40 compact disc expansion box has external SCSI ID switches that you must set for your configuration if you have more than one.
- You can set the voltage selector on the RRD40 expansion box to either 110 volts or 220 volts, depending on your power requirements.

### 4.1 Guidelines for Connecting Expansion Boxes

Use the following guidelines when connecting expansion boxes:

- Connect no more than three expansion boxes to the VAXstation 3100 SCSI port. Remember the following SCSI rules:
  - Seven SCSI IDs are available for customer configuration.
Multiple SCSI devices may be housed in one expansion box, but the number of SCSI devices cannot exceed seven. For more information on SCSI, please refer to the following documentation kit, *Small Computer System Interface: An Overview and a Developer's Guide*.

Each device must have its own unique SCSI ID.

Some SCSI devices may not be housed in an expansion box. Always limit the number of SCSI devices per SCSI bus to seven when you configure your VAXstation 3100 Model 48 system.

Use only the expansion boxes purchased for the VAXstation 3100. Expansion boxes purchased for use with other Digital equipment may need to be upgraded by Digital field service.

A system must have an integral hard disk and a SCSI controller in order to support an expansion box.

Always attach the 50-pin SCSI terminator that comes with your expansion box to the unused SCSI connector on the last expansion box.

All expansion boxes should be plugged into the same grounded power strip or electrical source.

Turn on all expansion boxes before you turn on a VAXstation 3100 system unit. Turn them on in the following order:

- RZ55 hard disk expansion box or boxes
- Other hard disk expansion boxes
- TK50Z-GA tape expansion box
- RRD40 compact disc expansion box or boxes

This procedure ensures that the device in each expansion box is ready to be used, and that the system firmware includes the device in its configuration.

After installing an expansion box, see Chapter 7 for instructions on how to display your new system configuration (TEST 50), and how to run the system exerciser (TEST 0).
4.2 Unpacking an Expansion Box

Note This section describes the TK50Z–GA expansion box, the RZ55 expansion box and the RRD40 compact disc drive. The newer RZ5x–xx expansion box options have their own user documentation. Please refer to individual RX5x–xx documentation for specific installation instructions.

Each expansion box is shipped from the factory with the following accessories, as shown in Figure 4–2:

- Either a cable with a 68-pin connector at one end and a 50-pin connector at the other end, or a cable with a 50-pin connector on each end and a 68-pin to 50-pin adapter, which you will plug into one end of your 50-pin cable. Use this cable (and the adapter, if necessary) to connect the expansion box to the system unit.

Note The 68-pin connector is shaped differently from the 50-pin connector. See Figure 4–2.

- One 50-pin to 50-pin cable. Use this cable to connect two expansion boxes in a chain.
- One power cord.
- One bottom dress cover (for RZ55 or TK50Z–GA). See Section 4.3.
- One 50-pin terminator, as shown in Figure 4–1. Use this to terminate the last expansion box.

Figure 4–1 50-Pin Terminator

MLO-002346
Make sure you have all the parts shown in Figure 4–2 before you set up your expansion box. Note that the RRD40 compact disc expansion box differs somewhat from the RZ55 or TK50Z–GA expansion box shown in the figure, but the cables and terminator are identical. The bottom dress cover that comes with the RZ55 and TK50Z–GA expansion boxes is not shown in Figure 4–2. See Section 4.3.

In addition, the TK50Z–GA expansion box comes with a blank tape cartridge, and the RRD40 compact disc expansion box comes with an empty compact disc caddy and test disc.

**Figure 4–2 Unpacking an RZ55 or TK50Z–GA Expansion Box**
4.3 Installing a Bottom Dress Cover

The RZ55 or TK50Z-GA expansion box comes with a bottom dress cover. To install the bottom dress cover, follow these steps:

1. Place the expansion box upside down on a level surface.
2. Remove the four rubber feet (optional).
3. Locate the bottom dress cover. Line up the molded inserts on the inside of the bottom dress cover over the holes on the bottom of the expansion box. Note that you must match the size of the inserts with the size of the holes. See Figure 4-3.
4. Slide the bottom dress cover until it locks into place.

Figure 4-3 Installing Bottom Dress Cover

![Diagram of Bottom Dress Cover with labeled parts: Bottom Dress Cover, Rubber Foot]
4.4 Preparing Your System for an Expansion Box

To add an expansion box to your system, you must first remove the SCSI cover and the terminator from the SCSI port.

1  Turn your system off (0).

2  To remove the SCSI cover, press your fingers on the locking tab and lift the cover to release it, as shown in Figure 4–4.

Figure 4–4    Removing the SCSI Cover
3 To remove the SCSI terminator, place your fingers under the loop and pull out. Figure 4–5 shows you how to remove the terminator.

![Figure 4-5 Removing the SCSI Terminator](MLO-002230)

Save the terminator and the cover. You must reattach them if you disconnect all expansion boxes from the system unit.
4.5 Connecting One Expansion Box

To connect a single expansion box to your system unit, follow these steps:

1. Turn both the system unit and expansion box to off (0).

**Note** See your software documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2. Turn the expansion box so that the back is facing you.

3. Verify the default SCSI ID switch positions. Each device is shipped from the factory with the default switch positions shown in Table 4–1. Read the switch positions from left to right.

   For detailed verification instructions, see
   - Section 4.7.2 and Figure 4–9
   - Section 4.8.1 and Figure 4–11
   - Section 4.9.1 and Figure 4–13

<table>
<thead>

<td>5</td>
<td>Down, Up, Down</td>
</tr>
</tbody>
</table>
4 Connect the 68-pin to 50-pin connector cable. See Figure 4–6 for the TK50Z–GA or the RZ55, and Figure 4–7 for the RRD40.

- Note the orientation of the pins in the system unit SCSI connector. There are more pins in the top row.
  Turn the 68-pin connector (small end of the cable) so its holes match the pins.
- Press the clips on the sides of the 68-pin connector and push the connector into the system unit SCSI port until the clips lock the connector into place.

**Caution** *Do not force the 68-pin connector into the SCSI port. You may damage the pins in the SCSI port.*

Connect the 50-pin connector (large end) to either port on the back of the expansion box and snap the bail lock loops in place.

5 Connect the 50-pin terminator that comes with the expansion box to the unused port on the expansion box. Figure 4–1 shows the 50-pin terminator.

6 Connect the power cord to the expansion box receptacle and plug the other end into the power source.
Figure 4–6 shows how to connect one RZ55 or one TK50Z–GA expansion box to your system unit.

**Figure 4–6  Connecting One TK50Z–GA or One RZ55 Expansion Box**

Figure 4–7 shows how to connect one RRD40 compact disc drive expansion box.

**Figure 4–7  Connecting One RRD40 Expansion Box**

Connector Cable  
Terminator  
Power Cord
4.6 Daisy-Chaining Multiple Expansion Boxes

You can add additional expansion boxes and daisy-chain the second box to the first. To daisy-chain (link expansion boxes together in series), follow these steps:

1 Turn the system unit and all expansion boxes off (0).

**Note**  See your software documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2 Remove the 50-pin terminator on the most recently installed expansion box. Store the terminator for future use.

**Note**  If you have more than one of the same device attached to your system, you must change the SCSI ID on the second device to an open ID number on the SCSI bus. See Appendix B for additional information.

You can daisy-chain devices to your system in any physical order.

3 Connect one end of the 50-pin to 50-pin connector cable to the new expansion box.

4 Connect the other end of the connector cable to an available port on the most recently installed expansion box.

5 Attach the 50-pin terminator that you just removed from the first expansion box to the unused SCSI port on the new expansion box.

6 Connect the power cord for the new expansion box to the expansion box power receptacle. Plug the other end into the same power source as the first expansion box. Each expansion box needs its own power connection.
Figure 4-8 shows how to daisy-chain two expansion boxes.

**Figure 4-8** Connecting Two Expansion Boxes

Terminator

50-Pin to 50-Pin Connector Cable
4.7 Adding the RRD40 Compact Disc Expansion Box

To provide additional read-only disk storage, you can add an external RRD40 compact disc drive, which is available in an expansion box. You already have an internal RRD40 compact disc drive that is built into your system unit.

The front of the RRD40 disc drive is similar in both versions. The RRD40 has an opening for a compact disc and one light (internal RRD40) or two lights (expansion box). When you turn on the RRD40 compact disc expansion box, the power light comes on. In both versions of the product, the activity light goes on when you load a compact disc in the drive; it flashes while the disc is transferring information.

If you have ordered an RRD40 compact disc expansion box, see Section 4.1 and subsequent sections earlier in this chapter for installation and unpacking instructions.

See Chapter 3 for instructions on inserting and removing a compact disc.

Figure 4–9 shows the RRD40 compact disc expansion box.

Figure 4–9  RRD40 Compact Disc Expansion Box

Opening for Compact Disc

Activity Light

Power Light
4.7.1 Verifying the Voltage Selector Position on the RRD40

Turn the RRD40 compact disc expansion box so that the back is facing you. Note that the expansion box has a voltage selector that can be set to one of two voltages (110V or 220V). Check that the voltage selector is set to the correct voltage for your power requirements. Figure 4–10 shows you the location of the voltage selector.

**Figure 4–10** RRD40 Expansion Box Voltage Selector and Factory SCSI ID Switch Positions

---

4.7.2 Verifying the SCSI ID on the RRD40

The RRD40 compact disc expansion box and the internal RRD40 compact disc drive in the Model 48 are shipped from the factory with the SCSI switches set to ID 4 (up, down, down, down). See Figure 4–10.
4.7.3 Resetting the SCSI ID on the RRD40

If you are adding an RRD40 compact disc expansion box to your Model 48 configuration, you must reset the switches. The expansion box should be set to an open ID (one that is not currently being used); for example, ID 1 with the switches in the following positions: down, down, up, down. See Appendix B for more information.

To determine available IDs on the SCSI-B bus, enter TEST 50 at the console prompt (>>>), then press the Return key. Your system configuration appears on the screen. The following example is for a fully configured Model 48 system. FFFFFF05 indicates an open SCSI ID. In the following example, the SCSI ID 0 to 7 are identified by the callouts 1 to 8.

SCSI-B 1C1C.0001 V1.3
FFFFF05 FFFFFF05 00000001 00000001 05020001 01000000 FFFFFF03 FFFFFF05
1 2 3 4 5 6 7 8

The SCSI IDs shown in the examples are identified below:

1. SCSI ID 0 — open
2. SCSI ID 1 — open
3. SCSI ID 2 — RZ23
4. SCSI ID 3 — RZ23
5. SCSI ID 4 — RRD40
6. SCSI ID 5 — TK50Z-GA
7. SCSI ID 6 — SCSI-B controller
8. SCSI ID 7 — open

4.8 Adding an RZ55 Hard Disk Expansion Box

To provide additional disk storage, the RZ55 hard disk is available in an expansion box. You can add one or more RZ55 hard disks to your system. Each hard disk provides an additional 332 megabytes of disk storage. See Section 4.1, Section 4.2, and Section 4.6 for connection instructions.
4.8.1 Verifying the SCSI ID on the First RZ55

Turn the expansion box so that the back is facing you. On the right side, in a small recessed area behind the handle, find the set of red and white switches surrounded by a label. Do not remove the label.

Figure 4–11 shows the back of the expansion box, the location of the switches, and default SCSI ID positions.

Verify that the switches are in the following positions (left to right): down, down, up. The RZ55 is shipped from the factory with the switches set at SCSI ID 1. You do not need to change the SCSI ID switch settings on the first RZ55 expansion box.

4.8.2 Resetting the SCSI ID on the Second RZ55

If you are adding a second RZ55, you must change its SCSI ID setting to 0 or any other open ID on the SCSI-B bus. For more information, see Appendix B.

To determine available IDs on the SCSI-B bus, enter TEST 50 at the console prompt (>>>), then press the Return key. Your system configuration is displayed on the screen, as shown in the example.
below. In the example, the SCSI IDs 0 to 7 are identified by the callouts 1 to 8. The code FFFFFFF05 indicates an open SCSI ID.

SCSI-B 1C1C.0001 V1.3
FFFFF05 FFFFFF05 00000001 00000001 05020001 01000000 FFFFFF03 FFFFFF05

1  2  3  4  5  6  7  8

The SCSI IDs shown in the example are identified below:

1  SCSI ID 0 — open
2  SCSI ID 1 — open
3  SCSI ID 2 — RZ23
4  SCSI ID 3 — RZ23
5  SCSI ID 4 — RRD40
6  SCSI ID 5 — TK50Z–GA
7  SCSI ID 6 — SCSI-B controller
8  SCSI ID 7 — open

Each device on the bus must have a unique SCSI ID. For SCSI ID 0, set the switches to the following positions (left to right): down, down, down, down as shown in Figure 4–12.
4.9 Adding and Using a TK50Z–GA Tape Expansion Box

The TK50Z–GA tape drive is available in an expansion box. The tape drive is located behind the protective door on the front of the box. The TK50Z–GA holds one removable TK50–K or TK52–K magnetic tape cartridge. Use the tape cartridges to load application software or data files, or to make copies (or backups) of your files. See Section 4.2 for additional information.

4.9.1 Verifying the SCSI ID on the TK50Z–GA

Turn the expansion box so that the back is facing you. On the right side, in a small recessed area, find the red and white switches surrounded by a label. Do not remove the label.
Figure 4–13 shows the back of the expansion box, the location of the switches, and the default SCSI ID switch settings.

**Figure 4–13 Verifying the SCSI ID on the TK50Z–GA**

The TK50Z–GA expansion box is shipped from the factory with the switches set to SCSI ID 5. The switches should be in the following positions (left to right): down, up, down. Leave the switches in the default (factory) position.

### 4.9.2 Inserting a Tape Cartridge

The TK50Z–GA tape drive has two primary controls: the cartridge release handle and the load/unload button.

- The cartridge release handle allows cartridges to be inserted, locked into position, and removed.
- The load/unload button controls winding and rewinding of the tape. The in (on) position of the load/unload button is for loading tape cartridges. The out (off) position is for unloading tape cartridges.

The TK50Z–GA uses TK50–K or TK52–K CompacTape tape cartridges. For additional information on tape cartridges, see Chapter 3.
TK50Z–GA controls and lights are described in Table 4-2 and Table 4-3.

Before you insert a cartridge, make sure the load/unload button is in the out (unload) position.

The red light in the load/unload button comes on for approximately 4 seconds during the automatic power-up test.

When the red light goes off and the green light comes on, it is safe to move the cartridge release handle.

If a cartridge is new, the tape drive performs a calibration sequence that takes approximately 40 seconds. The green light flashes rapidly and irregularly during calibration.

**Caution**  
*Do not move the cartridge release handle unless the red light is off and the green light is on.*

*Do not move the cartridge release handle while either light is flashing.*

*If the red light flashes rapidly at any time, press the load/unload button four times. If the problem persists, do not attempt to use the tape drive or remove the cartridge. See Chapter 6.*
Figure 4–14 shows how to insert and load a tape cartridge.

**Figure 4–14  Inserting and Loading a Tape in the TK50Z–GA**

1. **Raise the cartridge release handle.**

2. **With the arrow on the cartridge facing up and pointing into the drive, insert the cartridge into the drive.** The red light comes on and the green light goes off.

3. **Lower the cartridge release handle.** The red light goes off and the green light comes on.

4. **Push the load/unload button to the in (load) position.** The red light comes on and stays on. The green light blinks and then stays on, indicating that the cartridge is ready for use.

---

4–22 Adding and Using Expansion Boxes
4.9.3 Removing a Tape Cartridge

Figure 4-15 shows how to unload and remove a tape cartridge.

**Figure 4-15  Removing a Tape Cartridge from the TK50Z-GA**

1. Release the load/unload button to the out (unload) position. The red and green lights flash slowly as the tape rewinds. When the tape is completely unloaded, the red light goes off and the green light comes on.

2. Raise the cartridge release handle.

3. Remove the tape cartridge and store it in its plastic container.

4. Lower the cartridge release handle.
4.9.4 Using TK50Z-GA Controls and Indicator Lights

Table 4–2 summarizes the functions of the TK50Z-GA controls.

This chapter discusses connecting your VAXstation 3100 system to a network. Depending on your work environment, you can connect to a network in one of two ways:

- With ThinWire Ethernet cable
  See Section 5.1 for more information.

- With standard Ethernet cable
  See Section 5.2 for more information.

You can daisy-chain VAXstation 3100 systems to form a work group. For additional information, see Section 5.1.4.

All networking cables and connectors must be purchased separately and must be available in the offices before network connection.

### 5.1 Connecting to a ThinWire Ethernet Network

- If you are setting up a new work group, you may wish to designate someone as the **network coordinator** to help create and manage the work group, assign unique node names and addresses for each system, and provide administrative assistance.

- If you are connecting a work group to an existing network, ask the network coordinator for the best way to connect to the larger network. Check that each **DECnet node name** and **DECnet node number** in your work group is unique and does not already exist in the larger network. See your software documentation.
If you are new to networking and need additional networking information, consult your VAXstation 3100 Network Guide. The guide introduces networking concepts and identifies the hardware and software needed to connect many systems together to form a work group, and connect that work group to the network.

Complete the following tasks to connect your VAXstation 3100 to a ThinWire Ethernet network:

- Verify the network select button position
- Verify ThinWire Ethernet network installation
- Connect ThinWire Ethernet cable to your system unit

5.1.1 Verifying the Network Select Button Position

The ThinWire/standard Ethernet network select button is usually set in the out position when you receive your VAXstation 3100. There are two positions for the network select button:

- Out—standard Ethernet
- In—ThinWire Ethernet

Figure 5-1 shows the network select button in the in position, that is, set for ThinWire Ethernet. The light on the right of the button should be on when the system is on.
If your system is set incorrectly, follow these steps:

1. Locate the recessed network select button.

2. Press the network select button so that the light to the right of the network select button (ThinWire Ethernet Light) comes on.

5.1.2 Verifying ThinWire Ethernet Network Installation

To verify your ThinWire Ethernet installation:

1. Turn your VAXstation 3100 on (1). The green light to the right of the network select button should come on. The following display appears:

```
F...E...D...C...B...A...9...8...7...6...5...4...3...2...1
>>>```

If the console prompt (>>>) does not appear, press the halt button on the back of the system unit.
Figure 5–2 shows the location of the halt button.

**Figure 5–2  Halt Button**

2 At the console prompt, enter SHOW ETHERNET and press the Return key. The Ethernet hardware address appears in the following format:

ID XX-XX-XX-XX-XX-XX

For example:

ID 08-00-2B-07-A7-80

**Note** The letters ID are not part of the address.

3 Write your Ethernet hardware address here:

Ethemet hardware address

You need the Ethernet hardware address as system identification during software installation.

4 Enter TEST 50 at the console prompt and press the Return key.

If the last line of information in the display is NI 0000.0001, the ThinWire Ethernet subsystem is working.

If a number between 0000.0002 and 0000.7000 appears, there may be a failure in the Ethernet subsystem. Check that there are terminators attached to the T-connector. Enter TEST 1 at the console prompt and press the Return key. Now repeat
the TEST 50 command. If you continue to receive a failure indicator, call your Digital service representative. If NI 0000.7000, or any number above 0000.7000, appears on that line, check all Ethernet connections.

5.1.3 Connecting ThinWire Ethernet Cable

Follow these steps to connect a VAXstation 3100 to ThinWire Ethernet cable.

1. Turn your system off (O).

2. Remove a terminator from one side of the T-connector.

3. Firmly push a ThinWire cable connector on this side of the T-connector and turn it to the right until it locks into place.

   - If your system is the first or last system in a single ThinWire segment, leave the terminator attached to the other side of the T-connector. A segment is a length of cable made up of one or more cable sections connected with barrel connectors or T-connectors.

   - If your system is not the first or last system and you want to connect your system between two other systems, replace both terminators with sections of ThinWire cable.

Figure 5–3 shows you how to connect two ThinWire cable segments to a T-connector.

Figure 5–3 Adding ThinWire Cable to a T-Connector
4 Check that the T-connector is securely attached to the back of your system. Figure 5–4 shows the correct way to connect the first or last workstation in a ThinWire network.

**Note** Always turn the ribbed portion of a T-connector to the right until it locks in place.

**Figure 5–4 Checking ThinWire Cable Connections**

5.1.4 **Creating a Daisy-Chain Work Group**

A daisy-chain work group is created by serially connecting several workstations together on the same ThinWire cable segment. This cable segment can function as a standalone network or it can be connected to a larger network.

The benefit of a daisy-chain configuration is that it lowers the cost of wiring, but there is a risk that someone might improperly unplug a system and disrupt network connections among systems on the same ThinWire segment. Note that you must always terminate both ends of a ThinWire segment.
Figure 5–5 shows a Model 48 connected to several Model 38s, forming a work group.

**Figure 5–5 VAXstation 3100 Systems in a Daisy-Chain Work Group**

When you finish connecting your system to the ThinWire segment, visit each of the VAXstation 3100 Model 38 installations.

- Physically connect each Model 38 system to the ThinWire Ethernet cable in the same way you connected your Model 48.
- Collect the Ethernet hardware address for each of the Model 48 systems.

### 5.1.5 Connecting to a DECconnect Faceplate

If your office has been wired with Digital DECconnect products, you connect your VAXstation 3100 to the DECconnect faceplate in your office.

DECconnect cabling components support network configurations ranging from simple work groups to multimedia local area networks (LANs). No matter how large or small your network, the most visible DECconnect component in your office is the faceplate. A faceplate is a wall receptacle that provides a single network connection for your VAXstation 3100 system.

- A faceplate contains a single ThinWire **BNC connector**. Connect one VAXstation 3100 system to the BNC connector. Other systems can then be daisy-chained to the first system to form a daisy-chained work group. See Figure 5–5.
- Optionally, a faceplate may contain a special ThinWire Ethernet daisy-chain connector that permits behind-the-wall daisy-chaining of multiple faceplates to a single segment of ThinWire cable.
To connect your VAXstation 3100 system to a DECCconnect faceplate:

1. Attach one end of the ThinWire cable to the DECCconnect faceplate.

2. Check that the other end of the ThinWire cable is firmly attached to the ThinWire port on the back of your system unit. Figure 5–6 shows a VAXstation 3100 plugged into a DECCconnect office faceplate.

Figure 5–6 Connecting to a DECCconnect Faceplate

5.1.6 Troubleshooting the ThinWire Ethernet Segment

If you have verified your ThinWire Ethernet installation and have found problems, use the following checklist to make sure all connections are correct:

1. Check that the green light to the right of the network select button is on.

2. Check that the T-connector has not been disconnected from an operating ThinWire Ethernet segment.

Note If you need to remove a system from an active ThinWire segment, disconnect the center of the T-connector directly from the system.
Figure 5–7 shows the correct way to remove a T-connector from an active ThinWire segment.

**Figure 5–7** Removing a System from an Active ThinWire Segment

3 Make sure that no more than two ThinWire segments are connected to the T-connector. If you remove a ThinWire cable, replace it with a terminator.

4 Check that you have not disconnected a terminator from either end of an active ThinWire segment. This procedure disrupts network operation.

5 Check that all connections on the ThinWire Ethernet segment are secure.

6 Check that there are no branches off a ThinWire segment except through a **DEMPR** (Digital Ethernet Multiport Repeater). A DEMP R provides eight ThinWire Ethernet drops from a single standard Ethernet connection. See the *Workstations Network Guide* for additional information.

7 Check that a ThinWire segment is not looped from one port on the DEMP R to another port on the DEMP R.
After you have checked all ThinWire Ethernet connections, retest the Ethernet. Enter the following command at the console prompt (>>>):

>>> TEST 1

If a connection is established, the following display appears:

1...

If a connection is not established, the following message appears:

? 84 FAIL

Note Make sure that your Ethernet select switch is in the correct position, out for standard Ethernet, and in for ThinWire Ethernet.

If a connection is not established, perform the following steps to find the source of the failed connection:

- Remove the T-connector from the ThinWire port on the back of your system unit.

Note If you need to remove a system from an active ThinWire segment, disconnect the center of the T-connector directly from the system.

- Take the T-connector and two terminators that shipped with your system and plug the two terminators in place on the T-connector. Plug this T-connector with the terminators attached into the ThinWire port on the back of the system unit.

- Enter the following command at the console prompt:

>>> TEST 1

If TEST 1 passes, the following display appears:

If TEST 1 fails, you have an internal hardware problem with your VAXstation 3100 Model 48 and need to call your Digital service representative.

5-10 Connecting to a Network
5.2 Connecting to a Standard Ethernet Network

Complete the following tasks to connect your system to a standard Ethernet network:

- Put the network select button in the out position for standard Ethernet.
- Verify standard Ethernet network installation.
- Troubleshoot standard Ethernet.
- Connect a transceiver cable to your VAXstation 3100 system.

5.2.1 Setting the Network Select Button for Standard Ethernet

To use standard Ethernet on your VAXstation 3100:

1. Press the recessed network select button on the back of the system unit (see Figure 5–1) to the standard Ethernet (out) position.

2. When you turn on your system, the green light to the left of the network select button comes on, indicating you are ready to connect to standard Ethernet.

5.2.2 Verifying Your Standard Ethernet Network Installation

To verify standard Ethernet installation, follow these steps:

1. Check that the Ethernet loopback connector is attached to your system unit. If you have not attached the loopback connector, see Section 2.3.4.

2. Turn your system on (1). The light at the end of the loopback connector should come on. The following display appears:

F...E...D...C...B...A...9...8...7...6...5...4...3...2...1

3. At the console prompt, enter the following command:

>>> SHOW ETHERNET

The Ethernet hardware address appears on the screen in the following format:

ID XX-XX-XX-XX-XX-XX

Note The letters ID are not part of the address.
For example:

ID 08-00-2B-02-CC-71

4 Write down your Ethernet hardware address here. Each Ethernet hardware address is unique.

Ethernet hardware address _________________________

You need the Ethernet hardware address as system identification during software installation.

5 At the console prompt, enter TEST 50 and press the Return key.

If the last line of the display is NI 0100.0001, then the standard Ethernet subsystem is installed and working.
If a number between 0100.0002 and 0100.7000 appears on that line, there is a failure in the Ethernet subsystem. See Section 5.2.3 for troubleshooting.
If NI 0100.7000 or any number above 0100.7000 appears on that line, check all Ethernet connections.

6 After successfully completing the power-up self-test and verifying the network installation, remove the loopback connector and store it for future diagnostic testing.

7 Proceed to Connecting a Transceiver Cable later in this chapter.

5.2.3 Troubleshooting Standard Ethernet

If data appears on the last line of information above the console prompt (>>>) in your standard Ethernet TEST 50 display, you need to run some diagnostic tests:

1 Make sure the loopback connector is securely connected to the system and the green light is on. Note that if your system is already connected to an active Ethernet segment, your system can be tested in console mode without a loopback connector.
2 Turn your system off (0) and then on (1) again. Ethernet connection is verified during the power-up sequence.

3 After you have checked all Ethernet connections, retest the Ethernet subsystem. At the console prompt, enter the following command:

>>> TEST 1

If a connection is established, the following display appears:

1...

If a connection is not established, the following message appears:

? 84 FAIL

**Note** Make sure that your Ethernet select switch is in the correct position, out for standard Ethernet, and in for ThinWise Ethernet.

If TEST 1 fails, and your Ethernet select switch is in the correct position, you have an internal hardware problem with your VAXstation 3100 Model 48 and need to call your Digital service representative.
5.2.4 Connecting a Transceiver Cable

A transceiver cable is the physical connection between a standard Ethernet network interface, the H4000, H4005, or DELNI, and a VAXstation 3100.

To connect a transceiver cable:

1. Turn the system unit off (0).
2. Remove the loopback connector.
3. Attach the 15-pin connector on the standard Ethernet transceiver cable to the back of the system unit. Make the connection in this way if your system is a standalone networked system.
4. Use the screwdriver included in your shipment to move the sliding lock (part of the standard Ethernet connector) to make the standard Ethernet connection secure. Figure 5–8 shows the correct connection.

Figure 5–8 Connecting a Transceiver Cable to the System Unit

![Diagram of transceiver cable connection with sliding lock highlighted.]

MLO-002237

5–14 Connecting to a Network
If your system is to be part of a work group, you will need a DEMP to convert between the standard Ethernet and the ThinWire daisy chain. The use of a DEMP keeps the cost per connector to work group members down. Otherwise, it is necessary to have an H4000 and a transceiver drop cable for each new member of your work group. See Section 5.2.5 for information on using a DEMP to create a daisy-chain work group.

5.2.5 Creating a Daisy-Chain Work Group

A daisy-chain work group is created by serially connecting several workstations together on the same ThinWire cable segment. This cable segment functions as a standalone network or it can be connected to a larger network.

Figure 5–9 shows a Model 48 connected through a ThinWire Ethernet cable to several Model 38 systems forming a work group. The standard Ethernet connection is made to a DEMP through an H4000 transceiver.
When you finish connecting your system to the DEMP, visit each of the VAXstation 3100 Model 38 installations.

1. Physically connect each of the VAXstation 3100 Model 38 systems to the ThinWire cable.
   See Section 5.1.3, earlier in this chapter, for the correct way to install ThinWire Ethernet cable to VAXstation 3100 systems.

2. Collect the Ethernet hardware address from each of the VAXstation 3100 Model 38 users.
This chapter provides procedures for

- Identifying the source of a problem with your system
- Using the troubleshooting table
  If you know the source of your problem, see Table 6–1 for suggested solutions.

6.1 Identifying the Source of a Problem

To determine where your problem is, follow these steps:

**Note** See your operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

1. Turn all expansion boxes off (0).
2. Turn the monitor and all peripheral devices off (0).
3. Turn the system unit off (0).
4. Check that the following cables are correctly connected at both ends:
   - Monitor cable
   - Monitor power cord
   - System unit power cord
   - Expansion box connector cable
   - Expansion box power cord
   - Keyboard cable
- Mouse or tablet cable
- Network cables

At this point, all components should be off.

Now, turn your equipment on (1), in the order given in the following list.

1. Turn expansion boxes back on (1) in the following order:
   - RZ55 hard disk expansion box
   - Other hard disk expansion boxes
   - TK50Z-GA tape expansion box
   - RRD40 compact disc expansion box
   - Printer
   - System unit and monitor.

2. Adjust the brightness and contrast on your monitor.

If you still have a problem, refer to Table 6–1.

If, after checking the troubleshooting tables, you still have not found a solution to your problem, run system diagnostics programs, as described in Chapter 7.
6.2 Using the Troubleshooting Table

After you have determined the source of your problem, follow these steps:

- For monitor problems, see your monitor guide.
- For network problems, see Chapter 5.
- For problems with the RRD40 compact disc drive, see the diagnostic information in Section 7.8.1 and in the RRD40 Disc Drive Owner's Manual.
- For other problems:
  1. Note the symptoms of the problem.
  2. Check the Symptom column in Table 6–1 for a match.
  3. Check the conditions for that symptom in the Possible Cause column. If more than one possible cause is given, check the possible causes and their suggested solutions in the order listed.
  4. Follow the advice in the Suggested Solution column.
  5. Run system diagnostics, as described in Chapter 7.
  6. If the problem persists, call your Digital service representative.

### Network Problems

Refer to Chapter 5 or the *Workstations Network Guide* that comes with your system.
This chapter describes some of the diagnostics you can run on your VAXstation 3100 system to check that the system is running correctly. It also describes some of the common messages that are displayed during the power-up of your system.

This section includes information on the following:

- Power-up messages
- Self-test diagnostics
- Displaying your system's configuration
- Displaying devices installed in your system
- Using the system exerciser
- Test utilities
- Changing the keyboard language
- Rebooting your system
- Console command summary
- Password Security Feature
- Help display
- Service information

For information on status and test codes, see Appendix C.
7.1 Power-Up Messages

Every time you turn your system on, the system runs power-up tests. These tests check each device installed in your system. As each device is tested, a test number is displayed on the terminal screen. LED diagnostic lights on the rear of the system box indicate the status of the system as it is powering up.

Upon successful completion of the tests, the operating system starts to boot.

Note If your monitor does not display any information on the screen after the power-up test sequence, you may have a monitor, video, or system board failure. Check your monitor guide for more information.

In the following example of a power-up screen display, the elements are numbered and identified below.

KA42-B V1.0
F...E...D...C...B...A...9...8...7...6...5...4...3...2...1...

1 The CPU name (KA42-B) and the ROM version (V 1.0)
2 Test numbers for each device in system. See Table 7-1. Three dots (...) after a test number indicate that the device tested successfully. An underscore and two dots (_..) indicate that the optional device is not installed or the device has not been tested.

The Model 48 displays important information during its power-up test sequence. If the sequence displayed during power-up contains question marks or asterisks, failures may exist in the system. Use Table 7-1 to identify the faulty device.

To look at the status of a device, display the configuration table by running TEST 50 as described in Section 7.3.
### Table 7-1 Device Identifiers in Power-Up and Self-Tests

If you see question marks, single (?) or double (??), or asterisks (*), after a test number, an error has been detected. See Section 7.1.1.

#### 7.1.1 Power-Up Error Messages

If an error is detected during power-up, the power-up sequence contains single question marks (?), double question marks (??), or asterisks (*), next to the identifier for which the error was detected.

For example:

F.E.D.C.A...9...8...7?...6?...5...4...3...2...1...

A single question mark (?) next to a device indicates a minor problem, and the system will usually boot okay. See Section 7.1.2 for examples of problems flagged with a single question mark.
A double question mark (??) indicates a serious problem that will affect normal operation and use of the system. The device may need to be replaced. Contact your Digital service representative.

An asterisk (*) means the option device is installed, but its ROM code is not executed. Only device identifiers 7, 6, 4, 3, or 2 can have an asterisk (*).

Use Table 7–1 to identify the faulty or corrupted device. Then run a self-test on that device.

To check the status of a device, display the configuration table by running TEST 50 (see Section 7.3).

7.1.2 Power-Up Status Messages

Some common power-up status messages are shown and explained here:

■ System clock not set

? E 0040 0000.0005

System clock has not been set. Setting the clock is a normal part of software installation. The clock cannot be set while the system is in console mode. Once you set the clock, this status message will clear the next time the system is powered up.

■ Low battery

? D 0050 0000.0005

The system battery’s charge is low or completely discharged. Run the system for about 17 hours to fully recharge the battery.

■ No devices connected to internal SCSI-A bus

? 7 00A0 0000.4001

■ No devices connected to external SCSI-B bus

? 6 00B0 0000.4001

■ No Ethernet cable (ThinWire)

?? 1 00C0 0000.7004

This message indicates one or more of the following:

■ No cable is installed on the ThinWire Ethernet connectors.

■ No terminator on the ThinWire Ethernet port, or no terminator present at one or both ends of the segment.
- Network select button is set to wrong position. The correct positions are in for ThinWire Ethernet or out for standard Ethernet.
- Faulty cable or loose connection.
- No Ethernet cable (standard)

?? 1 00CO 0011.700E

This message indicates one or more of the following:
- No cable is installed on the standard Ethernet connectors.
- No loopback connector is installed on the standard Ethernet port.
- Network select button set to wrong position. The correct positions are in for ThinWire Ethernet or out for standard Ethernet.
- Faulty cable or loose connection.

To correct the problem, turn the system off (0), and then turn the system back on (1). If you still get the same error message, you may have a hardware problem with your Ethernet module.

**Note** See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

See Section 6.1 for the correct order in which to turn your system components off (0) and on (1).

### 7.2 Running Self-Tests

This section describes how to run self-tests on your system. Self-tests are used to display the status of the devices installed on your system. Self-test diagnostic programs reside permanently in the Model 48 read-only memory (ROM).

To test a device in your Model 48 system, follow these steps:

1. Use Table 7–1 to find the number or letter identifier for the device you want to test.
2 Put the Model 48 in console mode by pressing the halt button on the back of the system. Use a pen or a small pointed object to press the button. Figure 7-1 shows the location of the halt button.

**Note** See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

![Halt Button](image)

**Figure 7-1** Halt Button

3 Enter TEST and a space followed by the device identifier, and press the Return key.

    >>> TEST 7  [Return]

In this example, you are testing the SCSI-A bus controller. If you want to test a consecutive series of devices, enter TEST followed by the first and last numbers of the series, as shown in Table 7-1, and press the Return key.

    >>> TEST F 7  [Return]

In the above example, the system tests device F, then E, D, C, B, A, 9, 8, and 7.
The system displays the number of each device as it is tested, followed by three periods (...). If the self-test is successful, no question mark or error message is displayed, and the console prompt appears:

7...
>>> 

If the device is not installed, or is not tested, an underscore and two dots ( _.._ ) is displayed before the console prompt appears.

7...
>>> 

If a device fails the self-test, a question mark (?) follows the device identifier and a failure message is displayed before the console prompt appears.

7?...
84 FAIL
>>> 

If a self-test results in a failure, enter the TEST 50 command to display your system configuration (no need to press the halt button).

Call your Digital service representative.

### 7.3 Configuration Display

The configuration display is a table that lists the status of each device installed in your system. The configuration table holds the results of the self-test and power-up tests. It is updated each time the self-test program is run.

To display your system configuration, perform the following steps:

1. Put the Model 48 in console mode by pressing the halt button on the rear of the system.

   **Note** See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2. Enter the following:

>>> TEST 50 [Return]

This procedure displays the system configuration, Ethernet hardware ID, ROM revision levels, and status information.
Error information in the configuration display is valuable to your service representative. See Chapter 4 and Appendix B for additional information.

In the following example of a configuration display, the elements are numbered for identification below.

```plaintext
>>> TEST 50  [Return]

KA42-B V1.3  1
ID 08-00-2B-07-E3-83  2
  MONO  0000.0001  3
  CLK   0000.0001
  NVR   0000.0001
  DZ    0000.0001
  00000001 00000001 00000001 00000001 00000001 000012A0  4
  MEM   0010.0001
        01000000  5
  MM    0000.0001
  FP    0000.0001
  IT    0000.0001

SCSI-A  2828.0001 V1.3  6
FFFFFFFF05 FFFFFFF05 FFFFFFF05 00000001 FFFFFFF05 01000001 FFFFFFF03 FFFFFFFF05
SCSI-B  1C1C.0001 V1.3
FFFFFFFF05 FFFFFFF05 00000001 00000001 05000001 FFFFFFF05 FFFFFFF03 FFFFFFF05
  SYS   0000.0001
  SPLN  0000.0001 V1.3
  NI    0000.0001

1  CPU (KA42-B) and ROM (V1.0) version
2  Ethernet hardware address
3  Status codes for devices
4  DZ status codes. See Section 7.3.1.
5  Represents 16 megabytes of memory. See Section 7.5 for more information.
6  SCSI status codes. See Section 7.4.

Table 7-1 gives the mnemonics for devices that may be part of your configuration.

7-8 Running Diagnostics
Any code in the configuration table other than 0000.0001 on the lines for MM, MONO, DZ, FP, IT, or SYS devices indicates a **hard error**. If you observe a different code, contact your Digital service representative.

The other devices such as CLK, NVR, MEM, SCSI-A, SCSI-B, 8PLN, and NI may have a code other than 0000.0001 and still operate normally.

The following sections describe TEST 50 codes for DZ and SCSI-A and SCSI-B. For more information, see Appendix C.

**Note** *To update the information in the configuration display after making a change to the system configuration, you can either turn the system off and then back on, or enter the following command:*

```plaintext
>>> TEST F 1  [Return]
```

Reenter TEST 50 to view the current configuration.

### 7.3.1 DZ Status Codes

The DZ status codes contain the status of the four serial lines, the keyboard, and the mouse or tablet. The DZ status lines from the previous example are described in this example.

```
DZ     0000.0001
      00000001 00000001 00000001 00000001 00000001 00000001 000012A0
      1        2        3        4        5        6
```

1. Keyboard port status
2. Video port status
3. Communication port status
4. Printer port status
5. Keyboard self-test
6. Mouse or tablet self-test

Any status code other than 00000001 for the four ports and keyboard indicates a failure on that line. A status code of 00000000 for the keyboard indicates that the keyboard is disconnected. The sixth status code is for the mouse or tablet, and any code other than 000012A0 (good) or 00000000 (nothing connected) indicates a failure in the device.
7.4 Testing Internal Storage Devices

You can use TEST 50 to check the status of hard disk drives and tape drives installed in your system.

To determine the status of a device using the TEST 50 configuration display, you first

- Ascertain the device's SCSI ID setting.
- Find the SCSI-A line in the TEST 50 display.

Here is an example of the SCSI-A line. In this example, the eight alphanumeric SCSI-A codes are numbered 1 through 8 for your reference. These codes tell the functional status of each device and correspond to SCSI IDs 0 through 7.

?? SCSI-A 2828.0001 V1.3

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SCSI ID 0 — open</td>
</tr>
<tr>
<td>2</td>
<td>SCSI ID 1 — open</td>
</tr>
<tr>
<td>3</td>
<td>SCSI ID 2 — open</td>
</tr>
<tr>
<td>4</td>
<td>SCSI ID 3 — RZ22/RZ23/RZ24 hard disk</td>
</tr>
<tr>
<td>5</td>
<td>SCSI ID 4 — open</td>
</tr>
<tr>
<td>6</td>
<td>SCSI ID 5 — TZ30 tape drive</td>
</tr>
<tr>
<td>7</td>
<td>SCSI ID 6 — SCSI-A controller</td>
</tr>
<tr>
<td>8</td>
<td>SCSI ID 7 — open</td>
</tr>
</tbody>
</table>

An easy way to determine if any device errors are detected is by looking for double question marks in the left column as shown in the example. Two question marks indicate that one or more of the drives are faulty. To determine which device is faulty, examine the status codes. If you see a status code different from those listed in Table 7-2, the device may be faulty.
Table 7-2  SCSI Status Codes Indicating Good Devices

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>FFFFFFFF03</td>
<td>SCSI bus controller</td>
</tr>
<tr>
<td>00000001</td>
<td>RZ22, RZ23, RZ24, RZ55, or RZ56 disk drive</td>
</tr>
<tr>
<td>01000001</td>
<td>TZ30 tape drive</td>
</tr>
</tbody>
</table>

The status codes in Table 7–3 may indicate faulty devices or open SCSI IDs.

Table 7-3  SCSI Status Codes Indicating Possible Problems

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>FFFFFFFF05</td>
<td>Device is offline or not installed at this address.</td>
</tr>
<tr>
<td>FFFFFF05</td>
<td>Device not tested—possible SCSI bus controller error.</td>
</tr>
</tbody>
</table>

If a device is set to a SCSI ID that indicates FFFFFFFF05 in the SCSI-A line, the device’s SCSI ID may be set incorrectly or its cabling may be disconnected. Check the device’s cabling and SCSI ID setting, and then retest it. If the code is still FFFFFFFF05 after retesting, call your Digital service representative.

If you see any code different from those listed in Tables 7–2 or 7–3, call your Digital service representative.

For more information on SCSI status codes, see Appendix C.
7.5 Testing Memory Modules

To check the functional condition of memory modules, find the MEM line in the configuration display. If a system's memory is good, a line similar to the one below appears:

MEM 0008.0001 ①
     00800000 ②

The 8-digit decimal code following MEM (①) indicates the amount of error-free memory available, as follows:

- 0004.0001 means the system has 4 megabytes of memory
- 0008.0001 means the system has 8 megabytes of memory
- 000C.0001 means the system has 12 megabytes of memory
- 0010.0001 means the system has 16 megabytes of memory
- 0014.0001 means the system has 20 megabytes of memory
- 0018.0001 means the system has 24 megabytes of memory
- 0020.0001 means the system has 32 megabytes of memory

When the first three digits in the second line of code (②) match the three digits preceding the decimal in the first line (①) all the memory in the system is good. For example, in the example MEM display, the matching 008s indicate 8 megabytes of good memory.
When the system detects a memory error, you see double question marks and a second 8-digit error code in line two. For example:

```
?? MEM 0008.0020
      01000000  00000023
```

The new error code in line two indicates the module or modules containing failed memory. A digit other than 0 in the first seven digits indicates an error in a memory module. For example, the 2 in the example error code indicates an error in a memory module. A digit other than 0 in the last digit indicates failing memory on the system module. For example, the 3 in the last digit of the error code indicates failing memory on the system module.

To use the error code to determine the failing modules, do the following:

1. Find the nonzero digits in the error code.

2. Refer to Table 7–4 and find the line that shows your system’s total module configuration.

3. Locate each nonzero digit’s position in the line for your module configuration. The positions are numbered 1 through 8 from left to right and correspond to the digits in the error code.

The entry at each nonzero position indicates a failing module as follows:

- S indicates an error in the system module memory.
- 4 indicates an error in the 4-megabyte module.
- 8 indicates an error in the 8-megabyte module.
- 12 indicates an error in the 12-megabyte module.
- 16 indicates an error in the 16-megabyte module.
For example, if a system with a 4-megabyte memory module produces a 00000023 error code, the nonzeros in digits 7 and 8 show a “4” and an “S” in the 4 MByte module line in Table 7–4. The 4-megabyte memory module and the system module have failing memory and you should replace them.

Table 7–4 8-Digit Memory Error Code

<table>
<thead>
<tr>
<th>Installed Modules</th>
<th>Modules with Failing Memory</th>
<th>Nonzero Digits</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>1 2 3 4 5 6 7 8</td>
</tr>
<tr>
<td>System module</td>
<td></td>
<td>0 0 0 0 0 0 S</td>
</tr>
<tr>
<td>4 MByte module</td>
<td></td>
<td>0 0 0 0 0 4 S</td>
</tr>
<tr>
<td>4 and 8 MByte modules</td>
<td></td>
<td>0 0 0 0 8 8 S</td>
</tr>
<tr>
<td>12 MByte module</td>
<td></td>
<td>0 0 0 12 12 12 S</td>
</tr>
<tr>
<td>16 MByte module</td>
<td></td>
<td>0 0 16 16 16 16 S</td>
</tr>
<tr>
<td>4 and 16 MByte modules</td>
<td></td>
<td>0 0 16 16 16 16 4 S</td>
</tr>
<tr>
<td>12 and 8 MByte module</td>
<td></td>
<td>0 0 12 12 12 8 8 S</td>
</tr>
<tr>
<td>12 and 16 MByte modules</td>
<td></td>
<td>16 16 16 16 12 12 S</td>
</tr>
</tbody>
</table>

In Table 7–4, each digit contains the status of 4 banks of memory (1 bank = 1 megabyte of memory).
### 7.6 Device Display

You use the SHOW DEVICE command to show the devices installed in your system and where they are located on the SCSI bus.

```plaintext
>>> SHOW DEVICE [Return]
```

In the following example display, elements are numbered for identification below.

<table>
<thead>
<tr>
<th>VMS/VMB</th>
<th>ULTRIX</th>
<th>ADDR</th>
<th>DEVTYP</th>
<th>NUMBYTES</th>
<th>RM/FX</th>
<th>WP</th>
<th>DEVNAM</th>
</tr>
</thead>
<tbody>

<td>B/6</td>
<td>INITR</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```plaintext
>>> 2 3 4 5 6 7 8 9
```

1. Ethernet device and Ethernet hardware address
2. Device numbers for VMS operating system
3. Device numbers for ULTRIX operating system
4. Address—tells which SCSI bus (A or B) a device is on and the device's SCSI ID setting
5. Device type—disk, tape, RODISK (read-only disk)
6. Number of megabytes
7. Removable (RM) or fixed (FX) disk
8. Write-protected
9. Device name
Consider, for example, the following line from the previous display,

DKB400  RZ12  B/4/0/00  RODISK  205 MB  RM  WP  RRD40

This line indicates an RRD40 compact disc drive, located at
address ID 4 on the SCSI-B bus, which is a read-only, removable
disk in a write-protected device.

Table 7–5 explains the mnemonics used in the SHOW DEVICE
display.

<table>

7.7 Using the System Exerciser

If you suspect software problems, use the system exerciser to check the quality of your software media.

The system exerciser emulates an operating system through interaction among devices within the system. The system exerciser tests all internal and external devices. Use the system exerciser if your system has intermittent problems. It exercises each device once sequentially, then exercises them simultaneously. The system exerciser takes as long as 11 minutes to complete; it will not write on any medium.

To test your system, run the system exerciser:

1 Insert media in all devices. Put the RRD40 test disc in the compact disc drive, blank tape cartridges in the TK50Z–GA or TZ30 tape drives.

Note See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2 Put the system in console mode by pressing the halt button on the back of the system unit.
The following example shows the display that appears after the system exerciser has run all tests. Numbered display elements are explained below.

F 00B0  MONO  0000.0001  11 1005  0 00:00:35
C 0080  DZ   0000.0001  14   0 00:01:12
B 0010  MEM   0010.0001  5 00A7  0 00:02:02
7 0090  SCSI-A  6000.0001  22 0002  0 00:02:23
     3200.0001
6 00A0  SCSI-B  6000.0001  15 0002  0 00:02:56
     2200.0001
     3200.0001
     4100.0001
     7200.0001
1 00C0  NI    0000.0001  9  0 00:04:01
6 7 8 9

00 0.00:08:14
?06 HLT INST
    PC = 00005A0F

1  RZ23 disk drive (user disk)
2  RZ23 disk drive (system disk)
3  RZ23 disk drive (user disk)
4  RRD40 compact disc drive
5  TK50Z–GA expansion box
6  Column of test numbers of the device identifiers (see Table 7–1)
7  Column of device identifiers
8  Column of device mnemonics (see Table 7–1)
9  Status and error information for each device

Various graphics tests display on the screen during the system exerciser. Single question marks provide status information and do not interfere with the operation of the system. Double question marks in the final display indicate errors.
If you see double question marks next to the tape drive mnemonic on the SCSI-A or SCSI-B bus, and you ran the system exerciser with test cartridges in the drives, try different cartridges. Your cartridge may be the source of the problem.

If you see any other double question marks, call your service representative for assistance. Know the mnemonic associated with the double question marks. Table 7–1 identifies the device that corresponds to each mnemonic. Have this information ready when you call your service representative.

### 7.8 Test Utilities

This section discusses the RRD40 test disc utility and the erase disk utility for SCSI hard disks.

**Note** If an expansion box fails, first check all cable connections.

#### 7.8.1 RRD40 Test Disc Utility

The RRD40 compact disc drive is shipped with a test disc to use when you suspect RRD40 compact disc drive problems. Follow these steps to test your RRD40 compact disc drive.

**Note** See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

1. Press the halt button on the back of your system unit. The console prompt (>>>) is displayed on your screen.

2. Insert the test disc in the RRD40 compact disc drive, following the instructions in Section 3.2.

3. Enter TEST 0 and press the Return key. The system exerciser display appears on your screen.

4. The number 4100.0001 as part of the system exerciser display indicates a normal response code.

5. A 4101.0471 error code on the screen display indicates a problem with the RRD40 compact disc drive. A 4104.0A71 error code on the screen display indicates that the RRD40 compact disc drive has failed the test. Do not use the drive. Call your Digital service representative for assistance.
7.8.2 Erase Disk Utility for SCSI Hard Disks

The erase disk utility erases all data on a specified hard disk.

**Caution** This utility destroys all data on the hard disk.

**Note** See operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

1. Press the halt button on the back of your system unit. The console prompt (>>>) is displayed on your screen.
2. At the console prompt (>>>), enter SHOW DEVICE and press the Return key.
3. Enter TEST 50 and press the Return key. See Section 7.3 for an example of the TEST 50 screen display.
4. Identify the SCSI ID of the hard disk you wish to erase. See Appendix B for additional information.
5. Enter the TEST 75 command and press the Return key.

The following example shows the erase disk utility erasing the hard disk in an RZ55 expansion box. The hard disk in this example is located on SCSI-B bus address ID 1. The erasing procedure completes successfully.

**Note:** The output in the following example is common to both formatting and erasing programs. When you run TEST 75 ScsHDeerase program, the formatting portion will not be activated. Successful erasure will be indicated by the readout on line 6.
Caution This utility destroys all data on the hard disk.

PV_SCS_FMT_BBrepl=0
PV_SCS_FMT_SUCC

1 Select the SCSI-A bus or SCSI-B bus. SCSI-B bus is selected in the example.
2 Specify the SCSI ID. SCSI ID 1 is selected in the example.
3 Provide verification of your action: 1 = yes; 0 = no.
4 Your hard disk is being erased.
5 The number of bad blocks is listed.
6 Your hard disk has been successfully erased.

Running the erase disk utility on the hard disk located at SCSI address ID 3, SCSI-B bus produces a display like the one below, which includes an error.

>>> TEST 75 Return

SchDHerase

PV_SCS_FMT_CHN (0=SCSIA, 1=SCSIB)? 1
PV_SCS_FMT_ID (0,1,2,3,4,5,6,7)? 3
PV_SCS_FMT_RUsure (1/0)? 1
PV_SCS_FMTIng.........................?
PV_SCS_FMT_ERR#3

>>>
Table 7-6 lists the error messages that can appear in the FMTing line for the erase disk utility and gives an explanation for each message.

7.9  Changing the Keyboard Language

To change the language of your keyboard, make sure your system is in console mode by pressing the halt button on the back of your system unit.

Note  See your operating system documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

1  At the console prompt (>>>), enter TEST 54 and press The keyboard language menu appears.

2  Select a language from the keyboard language menu.

In the following example, the keyboard language is changed from English (3) to Italiano (9).

>>> TEST 54  Return

0) Dansk 8) Français (Suisse Romande)
1) Deutsch 9) Italiano
2) Deutsch (Schweiz) 10) Nederlands
3) English 11) Norsk
4) English (British/Irish) 12) Português
5) Español 13) Suomi
6) Français 14) Svenska
7) Français (Canadien) 15) Vlaams

### 7.11 Password Security Feature

In normal operation, your VAXstation 3100 Model 48 allows all console operator privileges, such as HALT, SET, DEPOSIT, EXAMINE, etc. Some customers require that direct access to memory and kernel system operation be restricted to authorized personnel only. To implement this restricted access, a password security feature is available in console access and operation.

A password security feature can be initiated by using the console command LOGIN, which is not the same as the VMS LOGIN command. The system will ask for a password, after which access to privileged console commands will be allowed only to users possessing the password code.
Note This password must be a character string of exactly 16 hexadecimal characters (0 through 9, A through F). It is important that you make a note of your password and store it in a secure place. If you forget your password, you must call your Digital service representative to regain access to the privileged console mode of your system.

Examples of how to set and enable the password feature appear in Section 7.11.1.

The privileged console commands are:

BOOT (with parameters)
DEPOSIT
EXAMINE
FIND
HALT
INITIALIZE
LOAD
MICROSTEP
NEXT
REPEAT
SET
SHOW
START
UNJAM
X
@

Any commands which modify memory and registers, or commands which transfer control of the CPU from the console monitor to another program such as BOOT or START.

This privileged state will continue until such time as the user leaves the console state by using the BOOT, CONTINUE, HALT or START commands. Subsequent entries into the privileged state can only be gained by use of the 16-character password.

Console commands accepted in nonprivileged mode (secure) include:

LOGIN (to allow password entry to the privileged state)
BOOT (with no parameters)
CONTINUE (if the user inadvertently pushes the HALT button, this command allows them to continue operations in a nonprivileged mode)
! (to allow the user to enter optional text that is not acted upon by the computer)
7.11.1 Enabling the Password Security Feature

Your VAXstation 3100 Model 48 arrives from the factory with the password security feature disabled, and the password set to 0. Follow these steps to initialize the password security feature on your system.

1. At the console prompt (>>>) type in SET PSWD and press the Return key.

2. The console responds with the prompt (1 >>>). Type in your password and press the Return key. As you type in the password, it will not echo on the screen.

   **Note** This password must be a character string of exactly 16 hexadecimal characters (0 through 9, A through F). It is important that you make a note of your password and store it in a secure place. If you forget your password, you must call your Digital service representative to regain access to the privileged console mode of your system.

3. The console will respond with the console prompt (2 >>>). Type in your password a second time, for verification, and press the Return key. Again, as you type in the password, it will not echo on the screen.

4. If the two passwords that you have typed in do not match, then the console will abort the command and the following error message will be displayed:

   ?31 ILL PSWD

5. If the two passwords that you have typed in match, your password is preserved in nonvolatile memory, preserving the password value, even if power is removed from the system unit.

Now your password is ready for use. If you wish to change the password, this can be done in the privileged mode using the SET PSWD command. To reset your password, follow these steps.

1. At the console prompt (>>>) type in SET PSWD and press the Return key.

2. The console responds with the prompt (0 >>>). Type in your old password and press the Return key. As you type in the password, it will not echo on the screen.
3 If you have correctly entered the old password, the console will respond with the console prompt (1 >>>). Type in your new password and press the Return key. Again, as you type in the password, it will not echo on the screen.

**Note** This password must be a character string of exactly 16 hexadecimal characters (0 through 9, A through F). It is important that you make a note of your password and store it in a secure place. If you forget your password, you must call your Digital service representative to regain access to the privileged console mode of your system.

4 The console will respond with the console prompt (2 >>>). Type in your new password again, for verification, and press the Return key. Again, as you type in the password, it will not echo on the screen.

5 If the two passwords that you have typed in do not match, then the console will abort the command and the following error message will be displayed:

```
?31 ILL PSWD
```

6 If the two passwords that you have typed in match, your new password is preserved in nonvolatile memory, preserving the password value, even if power is removed from the system unit.

Once your password is correctly entered, the password feature can be enabled by setting the password enable bit (PSE) to a one. Follow these steps to enable the password feature.

1 At the console prompt (>>>) type in SHOW PSE and press the Return key.

2 The console will respond with a 0 on the next line

3 At the console prompt (>>>) type in SET PSE 1 and press the Return key.

4 The password security feature is now enabled. You will no longer be able to use the privileged commands without logging in.

5 To test this, type in SHOW PSE at the console prompt (>>>) and press the Return key.

6 The console will respond with the following code:

```
?23 ILL CMD
```
7 You must now log in at the console prompt to use SHOW or other privileged commands. At the console prompt (>>>) type in LOGIN and press the Return key.

8 The console will respond with the prompt (? >>>). Type in your 16 character password and press the Return key.

9 If the password you type in is not correct, the console responds with the following code:

??23 ILL CMD

10 If the password was accepted, you may now proceed to use privileged commands or you may disable the password feature by typing the command SET PSE 0 at the console prompt (>>>) and pressing the Return key. As you perform any of the commands in the privileged state (except for SET PSE 0) and leave the console mode, the console will be left in a secure state. Use of the password will once again be required to perform privileged commands once you return to the console mode.

7.12 Rebooting the System After Running Tests

While you are running any of the tests or procedures in this chapter, you are in console mode. To resume normal operation of the Model 48, you must reenter program mode. There are two ways to enter program mode:

1 Enter BOOT at the console prompt and press the Return key. The system then searches each device in turn for the operating system software.

2 Enter BOOT followed by a space and the name of the device that contains your software, as shown in the following example:

>>> BOOT DKA300  [Return]

This procedure lets the system boot the software immediately, without searching.

See Appendix A for information on setting your system parameters.
7.13 Service Information

If you followed the corrective actions listed in Chapter 6 and Chapter 7 but you continue to have problems with your Model 48, call your Digital service representative. Before you call:

1 Write down the serial and model numbers of your system. Your service representative may need this number when you call. Your system is identified on the back of the system unit with a label: Model: VS42S-xx is a VAXstation 3100 Model 48 system. The numbers in place of xx identify the contents of the system unit.

2 Make notes based on Table 6–1. This information helps your service representative know the state of your system when the problem occurred.

3 Be prepared to read information from the screen and to enter commands at the keyboard while you talk to your service representative on the telephone.

4 Eight recessed diagnostic lights on the back of the system unit come on when you turn on the system. Write down the status of these lights. Your service representative may ask you to describe which lights are on. Figure 7–2 shows that lights 7, 4, 2, 1, and 0 are on.

Figure 7–2 Diagnostic Lights

Adding Options

This chapter describes hardware options available with your VAXstation 3100 Model 48 system.

8.1 Printers

When you order a printer, you need to order a DEC 423 serial line cable and the appropriate adapter to connect the printer to your VAXstation 3100 Model 48. As the correct adapter depends on which printer you use, consult your Digital representative to determine which adapter you need to order.

To connect a printer:

1 Use the documentation that came with the printer:
   - Unpack and set up the printer.
   - Set the baud rate on the printer to 4800 baud before connecting it to your Model 48.

2 Make sure that the printer and all equipment, including expansion boxes and the system unit, are off (0). See your software documentation for shutdown procedures.

3 Attach one end of the printer cable to the back of the printer. (Check the documentation that came with the printer.)

4 Attach one end of the serial line cable to the other end of the printer cable.
5. Attach the free end of the serial line cable to the printer port on the back of the system unit, as shown in Figure 8–1.

**Figure 8–1  Connecting a Printer Cable to the System Unit**

When building your software, you will need the following information to set up a printer port for your VAXstation 3100 Model 48. Table 8–1 lists the device names that are specific for your operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Device Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMS</td>
<td>TTA3:</td>
</tr>
<tr>
<td>ULTRIX</td>
<td>/dev/tty03</td>
</tr>
</tbody>
</table>

It is important that along with the device-specific information found in Table 8–1 you consult the following documentation for important information on connecting a printer to your operating system:

- For VMS:

  *System Management Volume 1A, Guide to Setting Up a VMS System*
  *General User Volume 4, DCL Dictionary*
For ULTRIX:

*System Manager Binder 3A, System Environment Setup*

The printers available for the Model 48 system are shown in Table 8–2.

<table>
<thead>
<tr>
<th>Printer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LN03</td>
<td>Desktop nonimpact laser printer that produces letter-quality text at 8 pages per minute.</td>
</tr>
<tr>
<td>LN03 PLUS</td>
<td>Enhanced LN03. Prints documents with both text and graphics.</td>
</tr>
<tr>
<td>LN03R ScriptPrinter</td>
<td>Nonimpact page printer that uses laser recording technology to produce high-quality POSTSCRIPT output, text, graphics, and images.</td>
</tr>
<tr>
<td>LA100</td>
<td>Desktop dot-matrix printing terminal.</td>
</tr>
<tr>
<td>LA75 Companion Printer</td>
<td>Desktop dot-matrix printer, sixel graphics.</td>
</tr>
<tr>
<td>LA50</td>
<td>Desktop dot-matrix printer, bitmap or character cell graphics.</td>
</tr>
<tr>
<td>LJ250/252 Companion/Color Printer</td>
<td>Desktop dot-matrix color printer, serial (LJ250) or parallel (LJ252).</td>
</tr>
<tr>
<td>LPS20 PrintServer</td>
<td>Networked POSTSCRIPT printer.</td>
</tr>
<tr>
<td>LPS40 PrintServer</td>
<td>Networked POSTSCRIPT printer.</td>
</tr>
</tbody>
</table>

The LPS20 and LPS40 printers are network devices and function as independent systems (nodes) in a network.
8.2 Modems

A modem is a device that converts computer signals to signals that can be sent over a telephone line. Modems are typically used for communications in large networks, for instance wide area networks (WANs).

The communications port on the back of the VAXstation 3100 system unit is set at the factory at 1200 baud. Refer to your modem documentation for instructions on setting your modem baud rate. Table 8–3 lists the modems available for the Model 48 system.

<table>
<thead>
<tr>
<th>Modem</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DF242 Scholar Plus</td>
<td>300, 1200, and 2400 bps (bits per second) full duplex asynchronous</td>
</tr>
<tr>
<td>DF224</td>
<td>300, 1200, and 2400 bps full-duplex asynchronous</td>
</tr>
<tr>
<td>DF212</td>
<td>300, 600, and 1200 bps full-duplex asynchronous</td>
</tr>
<tr>
<td>DF112</td>
<td>300 and 1200 bps full-duplex asynchronous</td>
</tr>
<tr>
<td>DF03</td>
<td>300 and 1200 bps full-duplex asynchronous</td>
</tr>
</tbody>
</table>

When you order a modem, you need to order a DEC 423 serial line cable and a 25-pin D-sub adapter/DEConnect passive adapter, to connect the modem to your VAXstation 3100 system. Autoanswer is not available; data leads only are connected.

To connect your modem:

1. Turn off (0) modem and other equipment, including expansion boxes and the system unit.

   **Note** See your software documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2. Follow the directions that come with your modem to set it up.
3 Use your modem documentation to clear the Force DSR attribute on your modem. (By your clearing the Force DSR attribute, your system will recognize the loss of modem connection, should it occur.)

4 Attach the 25-pin D-sub adapter/DECconnect passive adapter to the back of the modem.

5 Attach one end of the DEC 423 serial line cable to the 25-pin D-sub/DECconnect adapter.

6 Attach the free end of the serial line cable to the communications port on the back of the system unit, as shown in Figure 8–2.

Figure 8–2 Connecting a Modem to the System Unit
When building your software, you will need the following information to set up a modem port for your VAXstation 3100 Model 48. Table 8–4 lists the device names that are specific for your operating system.

Table 8–4  Device Names for Your Operating System

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Device Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMS</td>
<td>TTA2:</td>
</tr>
<tr>
<td>ULTRIX</td>
<td>/dev/tty02</td>
</tr>
</tbody>
</table>

It is important that along with the device-specific information found in Table 8–4 you consult the following documentation for important information on connecting a modem to your operating system:

- For VMS:
  
  *System Management Volume 1A, Guide to Setting Up a VMS System*
  
  *System Management Volume 5A: Networking, Guide To DECNET VAX Networking*

- For ULTRIX:
  
  *System Manager Binder 3A, System Environment Setup*

8.3 Tablet

The tablet with the puck or stylus may be used as a pointing device instead of the mouse for menu selection, graphics entry, and pointer control. The VSXXX–AB tablet system consists of a digitizing tablet, a 4-button puck, a 2-button stylus, and a 1.5-meter (5-foot) power/signal cable.

To connect a tablet, see Section 2.3.3 in Chapter 2.

8.4 Monitors

Several monitors are available for the VAXstation 3100. Consult your Digital sales representative for information.
8.4.1 Long Monitor Cable Option

Order a long monitor cable if you wish to locate your system unit away from your monitor. Before ordering cables, verify that a long cable is available for your configuration, especially for the SPX Color Graphics Accelerator.

To connect a long monitor cable to your monitor, follow the directions in your monitor guide with one exception: Connect the keyboard and mouse to the back of the system unit as shown in Section 2.3. Do not connect the keyboard and mouse to the monitor cable.

8.5 Graphics Coprocessor Module/Color Option

To add color to your system, you can order an 8-plane graphics coprocessor module/color option and color monitor.

The graphics coprocessor module/color option provides your system with a resolution of 1024 by 864 pixels and displays up to 256 colors from a palette of 16.7 million.

8.6 SPX Color Graphics Accelerator

The SPX Color Graphics Accelerator is a higher performance graphics option which supports both monitors with a high resolution of 1280 by 1024 pixels, or monitors with a lower resolution of 1024 by 864 pixels. The SPX Color Graphics Accelerator displays up to 256 colors from a palette of 16.7 million.
System Parameters

This appendix describes how to customize your system’s startup procedures, including how to

- Set the hardware to boot the software from a specified device.
- Set your system to have a particular mode of action should the system lose power.
- Set the default boot flags for your software.
- Use an alternate console.
- Set a remote trigger to permit a remote system to request a local boot of the system.
A.1 Automatic Booting

Booting your system means an internal program attempts to load the software from a mass storage device.

A.1.1 Setting the Default Boot Device

Set the default boot device to the disk drive on which you installed your operating system software. The Model 48 will boot from the designated device at startup. The operating system software can reside in one of the following places:

- On a hard disk in the system unit
- On a hard disk in an expansion box
- On a compact disc
- On a remote system that you access through the Ethernet

Table A–1 shows the names assigned to each of the possible devices. The default boot device should be set to one of the listed device names. Note that x refers to any number 0 through 7. The system disk for the Model 48 is usually DKA300.

<table>
<thead>
<tr>
<th>Device and Location</th>
<th>VMS and Boot Device Name</th>
<th>ULTRIX Device Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard disk in system unit (SCSI-A bus at IDx¹)</td>
<td>D KA x00¹</td>
<td>R Z x¹</td>
</tr>
<tr>
<td>Hard disk or RRD40 compact disc drive in system unit (SCSI-B bus at IDx)</td>
<td>D KB x00</td>
<td>R Z xx</td>
</tr>
<tr>
<td>Hard disk or compact disc in expansion box (SCSI-B bus at IDx)</td>
<td>D KB x00</td>
<td>R Z xx</td>
</tr>
<tr>
<td>Mass storage on remote system</td>
<td>E SA 0</td>
<td>S E 0</td>
</tr>
<tr>
<td>Tape (SCSI-A bus at IDx)</td>
<td>M KA x00</td>
<td>T Z xx</td>
</tr>
<tr>
<td>Tape (SCSI-B bus at IDx)</td>
<td>M KB x00</td>
<td>T Z xx</td>
</tr>
</tbody>
</table>

¹x = any number 0 through 7.
To change the default boot device:

1. See your software documentation for shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2. Check to be sure your system is in console mode. If the console prompt (>>>) does not appear on the screen, press the halt button on the rear of the system unit.

**Note** *If the system is running, the system displays the following information:*

```
?02 EXT HLT
PC = 000158E
>>> 
```

3. At the console prompt, enter SET BOOT and the name of the default boot device on which the software will reside. Then press the Return key.

```
>>> SET BOOT DKA300  [Return]
>>> 
```

If you enter SHOW BOOT at the console prompt, the name of the default boot device appears.

```
>>> SHOW BOOT  [Return]
DKA300
>>> 
```

### A.1.2 Changing the Default Recovery Action

When you receive your system, it is set to start up the operating system software automatically whenever you turn the system on, or in the event of an operating system software failure. You can change the default to suit your needs.

The options for setting the default recovery action are listed and explained in Table A–2. Default values or settings are the normal or expected values that are automatically included in a command.
Table A-2  Values for Default Recovery

<table>
<thead>
<tr>
<th>Value</th>
<th>Recovery Action</th>
<th>Result</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Automatic restart</td>
<td>System restarts automatically. Ideal for VAXstation Model 38 system.</td>
<td>None</td>
</tr>
<tr>
<td>2</td>
<td>Automatic reboot</td>
<td>Operating system software automatically reboots after every power-up. Ideal for VAXstation 3100 Model 48 system.</td>
<td>None</td>
</tr>
<tr>
<td>3</td>
<td>Automatic halt</td>
<td>Console prompt (&gt;&gt;&gt; ) appears after every power-up.</td>
<td>Enter BOOT(^1)</td>
</tr>
</tbody>
</table>

\(^1\) You must enter BOOT or BOOT and the device name (for example, BOOT DKA300) on which the operating system software resides.

If you want to change the recovery action setting, follow these steps:

1. Put the Model 48 in console mode by pressing the halt button on the back of the system unit.

   **Note** Check your software documentation for shutdown procedures before halting your system.

2. At the console prompt (>>>), enter the following:

   ```
   >>> SHOW HALT [Return]
   ```

   The value for the default recovery action appears:

   >>>

3. To set the recovery action to automatic restart should the system go down, at the console prompt (>>>), enter:

   ```
   >>> SET HALT 1 [Return]
   ```

4. To change to automatic reboot, at the console prompt (>>>), enter:

   ```
   >>> SET HALT 2 [Return]
   ```

5. If you want your system to halt after each time you turn it on, at the console prompt (>>>), enter:

   ```
   >>> SET HALT 3 [Return]
   ```

---

A-4  System Parameters
A.1.3 Setting the Default Boot Flags

Default boot flags (used in specialized startup procedures) should be set for the operating system installed on your Model 48.

To set the default boot flags:

1. Check to be sure the system is in console mode. If the console prompt (>>>) does not appear on the screen, press the halt button on the back of the system unit.

   **Note** Check your software documentation for shutdown procedures before halting your system.

2. Determine the default boot flag number (a hexadecimal number of up to eight characters) from your operating system software documentation.

3. Set the default boot flags. At the console prompt (>>>), enter:

   >>> SET BFLAG default_bootflag_number

A.2 Enabling the Server to Boot Satellite Systems Remotely

If the Model 48 is used as the boot server and operating system resource for members of a work group, the system manager can tell the server to boot the satellite systems from the server console without having to go to each satellite and boot it manually.

After initial setup, issue the following commands from the keyboard of each Model 38 satellite system:

1. The SET MOP command enables or disables the network listener. SET MOP 1 enables the listener bit.
   At each workstation, enable the listener bit using the SET MOP command as follows:

   >>> SET MOP 1
   SET MOP 0 disables the listener bit.

2. The SET TRIG command allows a remote system to request a local boot of the system. SET TRIG 1 enables the remote system's request.
   At each workstation, enable the state of the remote trigger using the SET TRIG command as follows:

   >>> SET TRIG 1
   SET TRIG 0 disables the remote system's request.
3 Set the password with the SET PASSWORD command. The value for the password can be any 16 hexadecimal characters, 0 through 9 and A through F. For security reasons, the password is one-way encrypted and cannot be displayed. This example shows the command for setting a password for a new account:

```
>>> SET PASSWORD new_password Return
```

To change a password, enter the SET PASSWORD command specifying first the new password, followed by the old password:

```
>>> SET PASSWORD new_password old_password Return
```

With the server booted, and the operating system installed and running, enter the following commands at the server keyboard:

```
$ MCR NCP Return
NCP> TRIG NODE remote_system_name SERVICE PASSWORD your_password Return
NCP> EXIT Return
```

The remote system should boot.

Remotely booting satellite systems is an option. You can also boot each of the systems in a work group by entering the following command at each system keyboard:

```
>>> B ESA0 Return
```

### A.3 Using an Alternate Console with Your System

The VAXstation 3100 Model 48 has a serial port to which you usually attach a printer. A picture of a small printer appears above this port. You can also attach a video terminal (or VAXstation 3100 Model 38 system) to this port and use it as an alternate (operator) console. You may want to add a terminal or a Model 38 to this port in the following cases:

- If you want a printout of a software installation: In this instance, add a supported hardcopy terminal or video terminal to the printer port. You can then connect a printer to the video terminal.
- If your server no longer has a monitor: You want to use your system only as a server, and still have access to console mode for software installation, maintenance, and troubleshooting.
To attach a video terminal or VAXstation 3100 Model 38 system to the serial port in order to use it as an alternate console terminal, you must set the alternate console switch on the back of the system unit. Perform the following steps:

1. Shut down your system. See your software documentation for proper shutdown procedures before turning your system off. Also, you should not turn off, halt, or restart the system without notifying work group members.

2. Turn the expansion boxes, monitor, and system unit to the off (0) position.

3. On the back of the system unit, find the S3 icon over the alternate console slide-switch. Down is the normal position.

4. Set the alternate console switch to the up (on) position. Use a small pointed object (do NOT use a pencil, as the graphite will damage the switch) to set the switch. When the switch is in the up position, you enable a video terminal or a Model 38 as an alternate console. The serial port is now a terminal port.

5. Attach one end of a DEC 423 serial cable to the serial port (printer port) on the Model 48 system unit and the other end of the serial cable to the serial port on the alternate console terminal.

6. Turn the alternate console terminal on (1).

7. If you are adding a terminal, check the baud rate. The baud rate should be set to 9600 baud. See your terminal documentation for additional information.

8. Turn all expansion boxes, the VAXstation 3100 Model 48 system unit, and the alternate console on (1).

9. If the console prompt (>>>) does not appear on the alternate console screen, press the Break key on the alternate console terminal keyboard.

   - At the Model 48 or alternate console keyboard, enter DTE at the console prompt (>>>) and press the Return key.

This command converts the system from console mode to terminal emulation mode. An asterisk is added to the console prompt after you enter the DTE command. The new prompt (*>>>) indicates that you are working in alternate console mode. All information displayed on the screen comes from the Model 48 system.
To exit terminal emulation mode, press `Ctrl/p` and press the Return key. The Model 30 system returns to local console mode (`>>>`).

The Model 48 system (with the S3 switch in the up position) will always attempt to use the serial line. The Model 38 system only uses the information after you enter the DTE command. The state of the S3 switch is only read at power-up.
This appendix contains information common to both the VAXstation 3100 Model 38 and VAXstation 3100 Model 48 systems. The information is for technical users who wish to create custom configurations.

SCSI is the acronym for Small Computer System Interface. SCSI is an interface designed for connecting hard disks and other peripheral devices to computer systems. SCSI is defined by an American National Standards Institute (ANSI) standard and is used by many computer and peripheral vendors throughout the industry.

Up to eight SCSI devices can share a SCSI bus (a cable). All data is sent back and forth on the cable. Each SCSI device attached to the cable looks at all the data, but only takes the data that has the proper device identification. Each of the eight devices is identified by a number from 0 to 7, called a SCSI ID.

### B.1 SCSI ID Default Settings

You are responsible for the SCSI ID settings on your equipment. Digital Equipment Corporation sets each SCSI device to a default SCSI ID before the equipment leaves the factory. You may never need to change a default setting. Default settings should only be changed when a system is configured with more than one of a particular device.

The number 7 is used by devices requiring the highest priority on the SCSI bus. The number 6 is reserved for the controller. The remaining six ID numbers (0 through 5) are available for custom configuration.
SCSI default settings for each VAXstation 3100 system are listed in Tables B-1, B-2, and B-3. The identification numbers listed give optimal performance on most systems. However, if you have special performance needs, you can set the identification number on each SCSI device manually. For most applications, SCSI IDs can be set arbitrarily as long as no two devices share the same ID.

Each device has a set of switches or jumpers that can be set to a specific SCSI ID. The TK50Z tape drive, the RZ55/56 hard disk drive, and the RRD40 compact disc drive are mounted in expansion boxes. Each of these devices has external switches that you can set.

The integral RRD40 compact disc drive (Model 48 system only), the RZ22 (Model 38 system only), RZ23 and RZ24 hard disks, the TZ30 tape drive, and the diskette drive (Model 38 system only) have internal switches or jumpers. These switches must be reset by your Digital service representative if you need to change their default settings.
B.2 Setting the SCSI ID

Enter TEST 50 at the console prompt (>>>), then press the Return key. Your system configuration is displayed on the screen. The example below shows the display for a fully configured Model 48 system.

SCSI-B 1C1C.0001 V1.0
FF00FF05 FF00FF05 00000001 00000001 05020001 01000000 FF00FF03 FF00FF05

1  SCSI ID 0 — open
2  SCSI ID 1 — open
3  SCSI ID 2 — RZ23, RZ24
4  SCSI ID 3 — RZ23, RZ24
5  SCSI ID 4 — RRD40
6  SCSI ID 5 — TK50Z-GA
7  SCSI ID 6 — SCSI-B controller
8  SCSI ID 7 — open

Note that FF00FF05 identifies an open ID. Remember that the external SCSI-B bus on a fully configured Model 48 system may contain a controller, two RZ23 or RZ24 hard disks, one TK50Z tape drive, and one RRD40 compact disc drive. This leaves three open IDs.

Follow these rules when you set SCSI IDs:

- You can have up to seven devices on one bus.
- Each device must have its own unique identifier.
- You cannot have two devices with the same SCSI ID on the same SCSI bus.
- Each SCSI bus must be terminated. Add a terminator to an unused SCSI port.
### Table B-1  SCSI IDs for VAXstation 3100 Model 38 (with Diskette Drive)

</tbody>
</table>

¹Normally used for system disk

**Note** Proper operation of the SCSI bus requires high-quality, properly configured cables and connectors to connect all devices. Only Digital-supplied cable assemblies intended for interconnecting SCSI devices should be used. This ensures that the impedance characteristics, signal propagation velocity, inductance, capacitance, cross-talk, grounding, conductor pairing, and shielding meet the requirements for proper bus operation. In addition, all units on the SCSI bus should be powered from a common AC power source. Proper operation of any SCSI bus that uses cable assemblies not supplied by Digital, or not configured in accordance with Digital's recommendations, is not guaranteed.
### B.3 Setting SCSI Switches

SCSI IDs (addresses on SCSI bus) and the corresponding switch positions shown in Tables B-4, B-5, and B-6 are the recommended IDs and switch positions for each expansion box.

#### Table B-4  RRD40 Expansion Box SCSI IDs and Switch Positions

<tr>
<td>Test 2 - Not supported</td>
<td></td>
</tr>
<tr>
<td>Test 1 - Ethernet network circuits (NI)</td>
<td>C-17</td>
</tr>
</tbody>
</table>
### C.1 Monochrome Video Circuits (MONO)

Error code format: 0000.XXXX

where XXXX is one of the codes listed in Table C-1.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No error.</td>
</tr>
<tr>
<td>0010</td>
<td>End of frame bit not set in interrupt pending register.</td>
</tr>
<tr>
<td>0020</td>
<td>End of frame failed to set for second time.</td>
</tr>
<tr>
<td>0040</td>
<td>End of frame failed to set for third time.</td>
</tr>
<tr>
<td>0080</td>
<td>No end of frame interrupt seen.</td>
</tr>
<tr>
<td>0100</td>
<td>Wrong IPL level for EOF interrupt.</td>
</tr>
<tr>
<td>0200</td>
<td>Interrupt request failed to clear interrupt pending register bit.</td>
</tr>
<tr>
<td>0400</td>
<td>End of frame interrupt did not occur.</td>
</tr>
<tr>
<td>0800</td>
<td>Error during cursor test.</td>
</tr>
</tbody>
</table>

### C.2 Time-of-Year Clock (CLK)

Error code format: 0000.XXXX

where XXXX is one of the error codes listed in Table C-2.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No error.</td>
</tr>
<tr>
<td>0003</td>
<td>Tell dispatcher to check time at the end of testing.</td>
</tr>
<tr>
<td>0004</td>
<td>Invalid time set.</td>
</tr>
</tbody>
</table>
| 0005        | Clock has not been reset since the last time battery voltage level was low.
| 0010        | Failure in time-of-year test.                                            |
| 0020        | Vrt bit failed to set after it was read the first time.                  |
| 0040        | Battery voltage level was down during the clock test.                    |
C.3  Nonvolatile RAM (NVR)

Error code format: 0000.XXXX

where XXXX is one of the codes listed in Table C–3. An error code
of 5 indicates that the battery voltage is below an acceptable level
for data in the NVR to be valid.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No error.</td>
</tr>
<tr>
<td>0004</td>
<td>Battery was down at last entry.</td>
</tr>
<tr>
<td>0008</td>
<td>NVR failed.</td>
</tr>
<tr>
<td>0080</td>
<td>The battery check code in the NVR did not agree with the expected check code.</td>
</tr>
</tbody>
</table>

C.4  Serial Line Controller (DZ)

This error code has two lines.

First line of error code format: 0000.XXXX

where XXXX is one of the error codes listed in Table C–4.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No error.</td>
</tr>
<tr>
<td>0002</td>
<td>Master reset failed.</td>
</tr>
<tr>
<td>0004</td>
<td>Failure in basic CSR test.</td>
</tr>
<tr>
<td>0008</td>
<td>Failure in CSR read-write test.</td>
</tr>
<tr>
<td>0010</td>
<td>Basic test of TCR failed.</td>
</tr>
<tr>
<td>0020</td>
<td>Read-write test of TCR failed.</td>
</tr>
<tr>
<td>0040</td>
<td>Transmitter ready test failed.</td>
</tr>
<tr>
<td>0080</td>
<td>Receiver ready test failed.</td>
</tr>
<tr>
<td>0100</td>
<td>Transmitter interrupt timeout.</td>
</tr>
<tr>
<td>0200</td>
<td>Receiver interrupt timeout.</td>
</tr>
</tbody>
</table>

(continued on next page)
### Table C-4 (Cont.)  Serial Line Controller Error Codes (0000.XXXX)

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0400</td>
<td>Either transmitter or receiver interrupted at the wrong priority.</td>
</tr>
<tr>
<td>0800</td>
<td>Receiver interrupt occurred when the receiver was not enabled.</td>
</tr>
<tr>
<td>1000</td>
<td>Data comparison error.</td>
</tr>
<tr>
<td>2000</td>
<td>Overrun error did not happen.</td>
</tr>
<tr>
<td>4000</td>
<td>This line is untested.</td>
</tr>
<tr>
<td>8000</td>
<td>Error in the modem control logic test.</td>
</tr>
</tbody>
</table>

The second line of six codes contains the status of each serial line as well as the status of the keyboard and mouse. This second line of status codes is provided so you can isolate a failing serial line. The status codes in the second line appear as follows:

0000WWWW 0000WWWW 0000WWWW 0000WWWW YYYYYYYY ZZZZZZZZ line 0  line 1  line 2  line 3  keyboard  mouse

where WWWW is one or more of the status codes listed in Table C-5, YYYYYYYY is the keyboard internal self-test code listed in Table C-6, and ZZZZZZZZ is the mouse or tablet internal self-test code listed in Table C-7.

### Table C-5  Serial Line Status Codes (0000WWWW)

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>Serial line tested successfully.</td>
</tr>
<tr>
<td>4000</td>
<td>Serial line is untested.</td>
</tr>
</tbody>
</table>

C-4  Power-Up, Self-Test, and TEST 50 Status and Error Codes
### Table C-6  Keyboard Self-Test Codes (YYYYYYYY)

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000000</td>
<td>No keyboard is connected.</td>
</tr>
<tr>
<td>00000001</td>
<td>Keyboard connected and tested successfully.</td>
</tr>
<tr>
<td>000000FD</td>
<td>Loopback connected and tested successfully.</td>
</tr>
</tbody>
</table>

### Table C-7  Mouse or Tablet Self-Test Codes (ZZZZZZZZ)

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000000</td>
<td>No mouse or tablet is connected.</td>
</tr>
<tr>
<td>000012A0</td>
<td>Mouse or tablet is connected and tested successfully.</td>
</tr>
<tr>
<td>00000054</td>
<td>Loopback is connected and tested successfully.</td>
</tr>
</tbody>
</table>
C.5 System Memory (MEM)

First line of error code format: 0000.XXXX

where XXXX is one of the codes listed in Table C–8. These codes show the error/status information for the memory on the system module and also the option memory module.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No error</td>
</tr>
<tr>
<td>0002</td>
<td>Failure in test address routine</td>
</tr>
<tr>
<td>0004</td>
<td>Byte mask failure</td>
</tr>
<tr>
<td>0008</td>
<td>Data/address test failure</td>
</tr>
<tr>
<td>0010</td>
<td>No memory found during sizing</td>
</tr>
<tr>
<td>0020</td>
<td>Unexpected parity error</td>
</tr>
</tbody>
</table>

The second line under the MEM code contains additional information on the memory in the system.

Second line status code format: YYYYYYYY ZZZZZZZZZ

where YYYYYYYY is the total number of bytes of good memory found in the system. If this field is not an even megabyte value (for instance, 00020000), then the second field, ZZZZZZZZZ, will be displayed to indicate the failing megabyte bank. Each bit in the ZZZZZZZZZ status code indicates the status for one bank of memory. In some cases, where a parity error is detected, the error may be on both the system module and the option memory module.
C.6 Memory Management (MM)

Error code format: 0000.000X

where X is one of the codes listed in Table C-9.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>No error</td>
</tr>
<tr>
<td>4</td>
<td>Memory management error</td>
</tr>
<tr>
<td>8</td>
<td>Illegal vector during MM test</td>
</tr>
</tbody>
</table>

C.7 Floating Point (FP)

Error code format: 0000.000X

where X is one of the error codes listed in Table C-10.

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0002</td>
<td>Floating point error</td>
</tr>
<tr>
<td>0004</td>
<td>Invalid floating point exception</td>
</tr>
</tbody>
</table>

C.8 Interval Timer (IT)

Error code format: 0000.000X

where X is either 2 for a fatal error or 1 for success.

C.9  SCSI Bus Controllers (SCSI-A and SCSI-B)

This section includes the codes for all SCSI bus controllers on all VAXstation 3100 systems.

*Note* A soft error occurs if nothing is connected to the SCSI-B bus.

First line of error code format: WWXX.YYZZ

where WW is the binary mask field of the devices selected successfully on the SCSI bus (see Table C–11), XX is the binary mask field of the devices tested successfully on the SCSI bus (Table C–11), YY is a set of binary error flags (see Table C–12), and ZZ is the status code and error code of the SCSI controller on the SCSI mass storage controller module (see Table C–13).

Second line of error code format: DDMMSSSTT

where the DD is the status of the data in phase of the INQUIRY command, MM is the status of the message in phase of the INQUIRY command, SS is the status of the status phase of the INQUIRY command, and TT is the status of the devices on the SCSI bus. All of these status codes are identical and are listed in Table C–14.

The second line of the error code indicates the status of the eight possible devices on the SCSI bus, including the controller on the SCSI mass storage controller module. The first code in this second line is reserved for the SCSI controller on the SCSI mass storage controller module. Codes 2 through 8 are for the devices connected to the SCSI bus. See Table C–14.

<table>

### C.11 Graphics Coprocessor Module/Color Option

Error code format: **XXXX.YYYZ**

where **XXXX** is the status of the failing test (ignore this field); **YYY** is one of the codes listed in Table C–16; and **Z** is 1 to indicate no error, 2 to indicate a **fatal error**, or 3 to indicate a status message.

C.12 Ethernet Circuits (NI)

Error code format: 0WXX.YYYY

where \( W = 1 \) if no heartbeat present, \( 0 \) = heartbeat present; XX is the number of retries over the Ethernet cable before a success; and YYYY is one of the codes listed in Table C–17. If your transceiver is not designed to provide a heartbeat (an H4001, for example), this condition will not apply to your situation. If your transceiver is designed to provide a heartbeat (an H4000, for example) and this bit is set to 1, you have an external hardware problem with your transceiver.

Hardware Specifications

This appendix lists the hardware specifications for the VAXstation 3100 Model 48 and its add-on devices.

- For VAXstation 3100 Model 48 system specifications, see Table D–1.
- For VAXstation 3100 Model 48 system dimensions, see Table D–2.
- For VAXstation 3100 Model 48 system storage conditions, see Table D–3.
- For VAXstation 3100 Model 48 operating and nonoperating conditions, see Table D–4.
- For RZ23 hard disk drive specifications, see Table D–5.
- For RZ24 hard disk drive specifications, see Table D–6.
- For RZ55/RZ56 hard disk drive dimensions, see Table D–7.
- For RZ55/RZ56 hard disk drive specifications, see Table D–8.
- For RZ55/RZ56 hard disk drive environmental specifications, see Table D–9.
- For TZ30 tape drive specifications, see Table D–10.
- For TK50Z–GA tape drive specifications, see Table D–11.
- For RRD40 compact disc drive specifications, see Table D–12.

Glossary

32-bit

The length of the internal data path of the CPU.

ANSI

American National Standards Institute.

application program

A program, such as a financial spreadsheet program, that performs an end-user task.

architecture

The internal configuration of a computer (processor) including its registers, instruction set, and input/output structure.

ASCII

American Standard Code for Information Interchange. A set of 7- or 8-bit binary numbers representing the alphabet, punctuation, numerals, and other special symbols used in text representation and communications protocol.

backup

A procedure that allows you to make copies of information to be retained in the event of a computer failure.

backup copy

A copy of files or software made for safekeeping in a backup operation.
backup process
   The process of making copies of the data stored on your disk so that you can recover that data after an accidental loss.

bad block
   A damaged block on a disk that the system cannot access. Blocks become damaged from wear or abuse.

barrel connector
   A female connector for connecting two sections of ThinWire cable.

baud rate
   The speed at which signals are serially transmitted along a communications line. One baud equals one bit per second.

binary
   A number system that uses two digits: 0 and 1. They are represented in system circuitry by two voltage levels, and programs are executed in binary form.

bit
   A binary digit; the smallest unit of information in a binary system of notation, designated as a 0 or a 1.

block
   A standard unit of storage space on a disk or tape surface; 512 bytes. Although a drive writes data to the disk or tape 1 byte at a time, a block is the smallest amount of space on a disk or tape that the system can access.

BNC connector
   See connector.

boot
   To bring a device or system to a defined state where it can operate on its own. See bootstrap.

bootable medium
   A hard disk, optical disc, or magnetic tape cartridge containing software (such as an operating system) that can be loaded into memory and executed.
**boot device**

The device on which the operating system software is loaded. The device that is booted at system startup. See device.

**boot node**

The management center for a work group and its major resource provider.

**bootstrap (or boot)**

To execute the bootstrap loader program, a program that runs automatically whenever system power is turned on. (The bootstrap loader loads the operating system software from a mass storage device and executes it.)

**bootstrapping**

The process by which the system software is transferred to your workstation. If you shut down your system and turn off the power, you need to start, or "boot," the system before you can use it again.

**BOT**

Beginning of tape. This is the first position on the tape where data can be written. BOT is set automatically. A tape is at the BOT position when it is first loaded into a TZ30 drive and when it is rewound.

**bus**

A channel (a set of wires) along which communication signals travel in a computer system.

**byte**

A group of 8 binary digits (bits). A byte is one-quarter of a VAX system longword.

**cable**

A sheathed group of electrical conductors.

**caddy**

The holder for the compact disc.

**calibration**

A calibration procedure that is used to position the heads and set up operating parameters every time a tape cartridge is loaded for the first time.
cartridge lever
This lever sets internal TZ30 mechanisms to accept or eject the tape cartridge. Move the lever to the unlock position to insert a tape, move to the lock position so the tape can be used, and move to the unlock position again to eject the cartridge after the tape has been completely rewound.

cartridge leader
A plastic leader at the beginning of the magnetic tape. The mating of the cartridge leader with the drive leader is like threading a needle. The leader inside the cartridge serves as the “eye” of the needle. Compare drive leader.

CD
See compact disc.

central processing unit (CPU)
The part of the system that controls the interpretation and execution of instructions.

cluster
A group of computers networked together that share disk storage, application programs, and other computer resources. See VAXcluster.

coaxial cable
A two-conductor, concentric, constant-impedance transmission cable.

command
A request you make to the operating system to perform a specific function. For example, a request to run a program.

communications line
A cable along which electrical signals are transmitted. Devices or systems that are connected by a communications line can share information and resources.

compact disc
A flat circular plate on which read-only optical data is stored. A laser optical reader, called a compact disc drive, retrieves this information.
computer system

A combination of system hardware, software, and external devices that performs operations and tasks.

configuration

The layout of the hardware in a particular computer system. See system configuration.

connection

The network path between a client and server.

connector

A BNC-style connector that connects a section of ThinWire cable to a T-connector, to a system, or to a barrel connector.

console

A device through which an operator communicates with the computer.

console mode

The state in which the computer is controlled from the console terminal. You can put your system in console mode by pressing the halt button on the rear panel of the system unit. Console mode is indicated by the console prompt (>>>) on the monitor screen. Compare program mode.

console prompt

A prompt used for communication between the user and the computer.

controller

A system component, usually a printed circuit board, that regulates the operation of one or more peripheral devices.

CPU

See central processing unit.

daaisy-chain

To link computers or expansion boxes sequentially.
data
A formal representation of information suitable for communication, interpretation, and processing by humans or computers.

data transmission
The movement of data in the form of electrical signals along a communications line.

debug
To detect, locate, and correct errors (bugs) in hardware or software.

DECconnect
Digital’s family of networking products that includes network electronics, cabling, and connections.

DECconnect faceplate
See faceplate.

DECnet software
Digital networking software that enables many Digital computer systems to form a network. It runs on systems in both local and wide area networks.

DECwindows
Digital Equipment Corporation’s windowing software that allows applications to be run on multiple windows on a workstation.

default
A value or setting that in most cases is normal or expected.

DELNI (Digital Ethernet Local Network Interconnect)
A local network interconnect product that provides eight separate network interfaces from a single transceiver tap.

DEMPR (Digital Ethernet Multiport Repeater)
A multiport repeater that provides eight ThinWire Ethernet drops from a single standard Ethernet connection.
DESTA (Digital Ethernet Station Adapter)

An adapter that acts as a ThinWire Ethernet transceiver. A DESTA adapter lets you connect a system with a standard Ethernet transceiver cable to ThinWire Ethernet.

device

The general name for any unit connected to the system that is capable of receiving, storing, or transmitting data. See input/output (I/O) device and controller.

device name

The name by which a device or controller is identified in the system.

diagnostics

Programs, located in read-only memory, that detect and identify abnormal system hardware operation. See read-only memory.

disc

See compact disc.

disk

A flat circular plate with a coating on which data is magnetically stored in concentric circles (tracks). A hard disk resides permanently inside a disk drive.

disk drive

A device that holds a disk. The drive contains mechanical components that spin the disk and move the read/write heads that store and read information on the surface of the disk.

diskless system

A VAXstation 3100 Model 38 system that has no storage capacity of its own.

disk server

A hardware system designed to provide operating system and data storage for other users.

down-line load

To send a copy of a system image or other file over a communications line to the memory of a target node. Also called remote install.
drive leader

A plastic leader inside the tape drive. The cartridge leader on the magnetic tape mates with the drive leader on the tape drive. The drive leader draws the magnetic tape out of the tape cartridge and onto a take-up reel inside the drive. As the tape is wound onto the take-up reel, it passes the magnetic read and write heads.

error message

A message displayed by a system to indicate a mistake or malfunction.

Ethernet

A communications concept for local networks that use coaxial cable.

Ethernet network

A type of local area network based on Carrier Sense Multiple Access with Collision Detection (CSMA/CD). In 1980, Digital Equipment Corporation, Xerox Corporation, and Intel Corporation developed a specification for the Ethernet local area network. The specification includes information on how to connect devices to a coaxial cable, how to configure nodes, the maximum number of nodes, and the distance between nodes.

faceplate

A wall receptacle that provides a single network connection for your workstation.

fatal error

An error from which a process cannot recover. Fatal errors are those that cause the CPU to stop, or are disk write errors not caused by the disk drive being powered down or write-locked. Errors that a process can recover from are not fatal. Same as nontrappable errors.

file

A collection of related information treated by the system as a single unit.

firmware

Software that is stored in a fixed or wired-in way, usually in read-only memory.

ground

A voltage reference point in a system that has a zero voltage potential.
**H4000 transceiver**

An Ethernet transceiver used to connect standard Ethernet communications equipment to standard Ethernet. The H4000 supports a heartbeat signal used in network diagnostics.

**H4000–BA transceiver**

An H4000–BA is an Ethernet transceiver used to connect standard Ethernet communications equipment to standard Ethernet. The H4000–BA does not support a heartbeat signal, because the heartbeat disrupts DELNI/DEMPR performance. See transceiver.

**H4005 transceiver**

A smaller and less expensive transceiver than the H4000 and H4000–BA. Its small dimensions permit installation in constricted spaces such as cable trays.

**hard disk**

A hard disk resides permanently inside a disk drive.

**hard error**

A nonrecoverable error.

**hardware**

The physical equipment, both mechanical and electrical, that makes up a system. Compare software.

**hardware Ethernet address**

The unique Ethernet physical address associated with a particular Ethernet communications controller. It is a combination of 12 characters, including letters (A to F) and numbers (0 to 9). The characters are grouped in six pairs; each pair is separated by a hyphen (-). For example, 08-00-2B-04-FD-C9 is a valid Ethernet address.

**head**

The part of a hard disk drive, or tape drive that reads, records, and erases data. Also called read/write head.
heartbeat

A signal generated by the H4000 Transceiver and transmitted on the collision pair of the transceiver cable. This signal indicates that a packet was sent and is used to verify that the collision detection circuitry is functional.

host

The system on which the client is operating.

host system

The primary or controlling computer in a multiple-computer network.

housing

The plastic case in which a compact disc sits.

icon

Graphic representation of an application or object. Icons appear on the back of the system unit to identify lights, switches, and the devices that can be plugged into the connectors.

IEEE

Institute of Electrical and Electronics Engineers.

initialize

To prepare a new tape for use. Initializing erases any files stored on the tape.

input

Power, energy, or data entered into a device or system in order to produce a result or output.

input/output (I/O) device

A piece of equipment that accepts data for transmission to (input) and from (output) the system. For example, a monitor.

input device

A keyboard, mouse, tablet, track-ball, button, key, or other source of input to the workstation.
insert
Placing a tape cartridge in the TZ30 tape drive. The cartridge leader mates with the drive leader during insertion of the tape.

interactive
A method of communicating with the computer. In an interactive session, you enter a command at the keyboard; the system executes the command and responds with a prompt character for another command.

interface
An electronic circuit board that links an external device to a computer; software that allows the components of the system to communicate with each other.

kilobyte (KB)
When referring to memory or secondary storage capacity, 1024 bytes.

LAVc
See local area VAXcluster.

LED
Light-emitting diode. The diagnostic lights on the Model 48 system enclosure are LEDs.

link
A communication path between two nodes. A physical link is the electrical connection between two nodes. A logical link implies that two nodes are able to communicate regardless of whether they have a direct physical link.

load
To copy software (usually from a peripheral device) to memory. Also, to place a compact disc in an RRD40 compact disc drive or a tape in a tape drive.

When the tape cartridge has been inserted correctly and the TZ30 cartridge lever is moved to the lock position, the TZ30 tape drive performs tests and automatically winds the tape to BOT when a tape is loaded.

load device
The drive that holds the distribution medium during software installation.
**local area network (LAN)**
A high-speed communications network that covers a limited geographical area, such as a section of a building, an entire building, or a cluster of buildings. It is a privately owned communication network whose speed is upward of 1 megabit per second.

**local area VAXcluster**
A group of two or more computers connected by an Ethernet cable or computer-interconnect. In a LAVc, one computer (the VAXstation 3100 Model 48) serves the other VAXstation 3100 Model 38 systems, starts them, and manages the resources that they share.

**local device**
A disk drive, tape drive, or other device that is only available to the computer to which it is directly connected.

**logical link**
Two nodes that are able to communicate by means of software regardless of whether they have a direct physical link.

**magnetic tape**
A tape made of plastic and coated with magnetic oxide, used to store data. Also called magtape.

**megabyte (MB)**
A unit of measure equal to 1,000 kilobytes or 1,048,576 bytes.

**memory**
The area of the system that electrically stores instructions and data, often temporarily.

**memory module**
A printed circuit board that contains additional memory for the system.

**MIPS**
Millions of instructions per second (a measure of processor performance).
modem
A device that converts computer signals to signals that can be sent over a telephone line.

module
A printed circuit board that contains electrical components and electrically conductive pathways between components. A module stores data or memory or controls the functions of a device.

monitor
A video device that displays data.

mouse
A pointing device that, when moved across any surface, causes a corresponding movement of the pointer on the screen. A mouse can have one or more buttons.

MS-DOS
An operating system produced by Microsoft Corporation.

network
Two or more computers linked by communication lines to exchange information and share resources. A network can vary in size; it can be contained within an office, a department, a building, a country, or distributed worldwide. See local area network and wide area network.

network coordinator (network manager)
The person who manages the network, assigns unique node names, node addresses, and cluster group IDs for each system on the network, configures and tunes network software, monitors network performance, diagnoses and troubleshoots network problems and provides administrative assistance to network users.

node
A computer, workstation, or peripheral device that is connected to a network. Also, a node is an end point to any branch of a network or a junction common to two or more branches.

offline
Indicates that a system is unavailable; it has either been turned off or shut down.
online
Indicates that the power has been turned on and equipment and devices can communicate with the system.

operating system
A collection of system programs that control the operation of the system and allow the user access to data files, input/output devices, and applications programs. The operating system software performs such tasks as assigning memory to programs and data, processing requests, and scheduling jobs.

optical disc
See compact disc.

output
Data that has been processed by the computer.

output device
A device that accepts data from the system. For example, a printer.

password
The "key" to an account. You use your password, in combination with your user name, to start a session. The system checks your password to be sure you are authorized to use the account.

peripheral device
A device that provides the CPU with additional memory storage or communication capability. Examples are disk drives and printers.

physical link
The electrical connection between two network nodes.

pixel
A picture element. A location on the monitor screen that can be selectively turned on or off. The basic unit of a graphic display.

plotter
A device to construct visual representations of data by an automatic pen or pencil. Plotters can also receive plotting coordinates from digital computers.
pointing device
An input device that allows you to control pointer position on the screen. See mouse, puck, and tablet.

port
The name of the logical socket at the back of the system unit to which a terminal, printer, or other communication device is connected. For example, there is one switch-selectable port on the back of the VAXstation 3100 system unit for Ethernet devices.

power-up sequence (power up)
A series of ordered events that occur when you supply power by turning on the system.

printer
A peripheral device that provides paper copies of information stored on the system.

private device
A disk drive, tape drive, or other device available only to computers that are directly connected to it.

program
The sequence of instructions the system uses to perform a task. See software.

program mode
The state in which the computer is controlled by the operating system. After the operating system is installed, the system will always operate in program mode unless you put it into console mode. Compare console mode.

prompt
Words or characters displayed by the system, asking you to provide input.

puck
A palm-sized device that slides on a tablet's surface. The puck and tablet together function as a pointing device. See pointing device and tablet.
random-access memory (RAM)
Memory that can be both read from and written to and can randomly access any one location during normal operations. The type of memory the system uses to store the instructions of programs currently being run.

read-only memory (ROM)
Memory that cannot be modified. The system can use (read) the data contained in ROM but cannot change it.

remote
Linked to a computer by communication lines.

resolution
A measure of the precision or sharpness of a graphic image. Often a function of the number of pixels on a screen.

ROM
See read-only memory.

run
A single continuous execution of a program (noun). To execute a program (verb).

satellite node
A node that is booted remotely from the system disk on the boot server. In general, a satellite node is a consumer of cluster resources. It relies on a boot server for system software and management services. Compare server node.

scratch disk
A disk where a save set is stored. By default, it is SYS$UPDATE.

SCSI
See Small Computer System Interface.

section
A single length of ThinWire Ethernet cable terminated at each end with a connector.
segment
A length of ThinWire Ethernet cable made up of one or more cable sections connected with barrel connectors or T-connectors.

server
Hardware or software that provides a specific set of services to a satellite or client.

server node
In a VAXcluster or a work group, a computer that is used to start the satellite nodes and to manage their use of common resources.

single-segment LAN
A LAN composed of only one coaxial cable segment. See also section and segment.

Small Computer System Interface (SCSI)
An interface designed for connecting disks and other peripheral devices to computer systems. SCSI is defined by an American National Standards Institute (ANSI) standard and is used by many computer and peripheral vendors.

soft error
A recoverable error.

software
Programs executed by the system to perform a chosen or required function. Compare hardware.

standalone workstation
A workstation that starts and operates alone without another computer.

standard Ethernet cable
Coaxial cable used to connect wiring centers and computer facilities, floors of buildings, and standalone ThinWire segments. It is rugged, reliable, and immune to external factors that limit high-speed 10 megabit-per-second data communication.

standard Ethernet network
An IEEE standard 802.3 compliant Ethernet network connected with standard Ethernet cable. Also known as ThickWire Ethernet.
station
A single addressable device on a LAN.

storage medium
A device, such as a tape, capable of recording information.

store
To enter data into a storage device, such as a disk, or into memory.

stylus
A pen-like device that draws on the tablet's surface and together with the tablet functions as a pointing device. See pointing device and tablet.

system
A combination of hardware, software, and peripheral devices that perform specific processing operations.

system configuration
The layout of the hardware in a particular computer system.

system management tasks
Tasks performed by an assigned person (usually the system manager) to operate and maintain the system.

tablet
An absolute-positioning input device composed of a flat-surfaced digitizing tablet and a puck or stylus. The tablet is a drawing surface. The puck and stylus are pointing devices that move the cursor on the monitor screen, draw graphics, and make selections from the menu.

tape drive
A device that contains mechanical components and holds, turns, reads, and writes on magnetic tape.

T-connector
Connector used to join ThinWire Ethernet cable sections.
TCP/IP

terminal

An input/output device that lets you communicate with the system. Terminals are divided into two categories: video and hard-copy.

terminator

A connector used on one or both ends of an Ethernet segment that provides the 50-ohm termination resistance needed for the cable.

ThinWire

A Digital trademark used to describe its Ethernet products used for local distribution of data.

ThinWire cable

All Digital Ethernet products can connect to ThinWire cable. ThinWire cable can be used in any size of environment; it is flexible, fully compatible with standard Ethernet, inexpensive, and offers 10 megabit-per-second communication.

ThinWire connector

The connector on the rear of the system unit to which the ThinWire Ethernet cable is attached.

transceiver

A device that provides a single physical connection between standard Ethernet and Ethernet communication equipment. See H4000 transceiver.

ULTRIX operating software

Digital Equipment Corporation’s implementation of the UNIX operating system. DECSnet–ULTRIX networking software provides an Ethernet-based communication link between the VMS and ULTRIX operating systems.

unshielded twisted-pair cable

Multiple-conductor cable whose component cables are paired, twisted, and enclosed in a single jacket.
VAXcluster configuration
An integrated organization of VAX computer systems. VAXclusters simplify the task of setting up and maintaining many systems at the same time, because all the workstations in a VAXcluster are under a single management domain.

VMS operating software
Digital Equipment Corporation's proprietary operating system.

Wide area network (WAN)
A network that covers a large geographical area, spanning buildings, cities, or countries. WANs typically use common carriers, such as the telephone network, to transport messages over most or part of the distance between computers.

Winchester disk
A hard disk permanently sealed in a drive unit to prevent contaminants from affecting the read/write head. The sealed head/disk assembly (HDA) helps to increase drive reliability and ensure data integrity.

Window
An area on your monitor screen in which you can start, run, and view a separate process.

Word
The largest number of bits (16) that the VAXstation 3100 system can handle in an operation. These systems can also handle longwords (that is, two words or 32 bits).

Workstation
A single-user system that offers high-performance, high-resolution graphics and can function in a network environment.

Write protect
To protect a disk or other storage medium from being added to, revised, or deleted.

Write-protect switch
A switch on the CompacTape cartridge that prevents data from being written to the tape.
X Window System

A windowing system architecture that allows the execution and display of applications to be independent. Specific components of the architecture control the display of applications. Different components determine how applications run. Since its introduction by MIT, the X Window System has become an industry standard.
