## Operating Systems

### A Choice of Operating Systems

Digital's Alpha AXP architecture allows you to choose from various operating systems for use on your DEC 3000 Model 500X AXP system. The operating system is the core software installed on your DEC 3000 Model 500X AXP system, which allows you to install and run applications.

### Supported Operating Systems

Currently, both of the following operating systems are supported for use on your DEC 3000 Model 500X AXP system:

- OpenVMS AXP
- DEC OSF/1 AXP

These two are the operating systems supported with the first shipments of the DEC 3000 Model 500X AXP system. Other operating systems may be supported at a later time.

### OpenVMS AXP Operating System

The OpenVMS AXP operating system is a general purpose, multiuser operating system that can be used in many different environments for a wide variety of applications.

### Features of OpenVMS AXP

The OpenVMS AXP operating system promotes ease-of-use and improved programming productivity, and it facilitates system management.

OpenVMS AXP offers a combination of commercial features and open system benefits, including the following capabilities:

- Integrated networking
- System security
- Distributed computing
- Windowing capabilities

Additionally, OpenVMS AXP supports a large number of industry standards to facilitate application portability and interoperability.
**DEC OSF/1 AXP Operating System**

DEC OSF/1 AXP is Digital Equipment Corporation's implementation of the Open Software Foundation (OSF) operating system components and Motif graphical user interface and programming environment.

**Description of DEC OSF/1 AXP**

DEC OSF/1 AXP is compliant with the OSF Application Environment Specification (AES), which specifies the interface to support portable applications designed to run on a variety of hardware platforms.

In addition, the DEC OSF/1 operating system complies with these standards and industry specifications:

- FIPS 151-1
- POSIX (IEEE Std. 1003.1-1988)
- XPG3 BASE branding
- XTI
- AT&T System V Interface Definition (SVID) Issue 2 (Base System and Kernel Extensions)

**DEC OSF/1 AXP Architecture**

The DEC OSF/1 AXP operating system is an advanced kernel architecture based on Carnegie Mellon University's Mach V2.5 kernel design with components from Berkeley Software Distribution 4.3 (BSD) and other sources. DEC OSF/1 AXP provides numerous features to assist application programmers in developing applications that use shared libraries, multithread support, and memory mapped files.

To ensure a high level of binary compatibility with the ULTRIX operating system, the DEC OSF/1 AXP operating system is compatible with the Berkeley 4.3 programming interfaces.

**You May Have Factory-Installed Software**

If there is a yellow sticker over the system power connector on your DEC 3000 Model 500X AXP system, the operating system is factory-installed on an internal fixed disk drive, and you can start it on your system using either the OpenVMS AXP Factory Installed Software (FIS) procedure, or the DEC OSF/1 AXP Factory-Installed Software (FIS) Startup Procedure.

Chapter 5 describes how to start your system if it has a factory-installed operating system.
Software Product Descriptions (SPD)

The Software Product Description (SPD) is the official defining document for software products licensed by Digital Equipment Corporation, including third-party products licensed by Digital. An SPD describes all important functional characteristics of the software. The terms and conditions under which the corporation sells and licenses its software products identify SPDs as the documents that specify Digital’s obligation under software warranty.

SPDs also describe a software product’s system environment and identify required and optional hardware and software. All information contained in the SPD is valid in the international marketplace.

For more information on the SPD for your operating system, please contact your Digital sales representative.

Graphics Capabilities

All DEC 3000 Model 500X AXP systems are shipped with the HX 2D graphics capabilities integral to the system module. This provides 8-plane, accelerated 2D graphics and windowing operations for your system.

Additional graphics and multimedia capabilities are available via a TURBOchannel graphics module that can be installed in your system. Digital and third-party suppliers provide a wide variety of TURBOchannel-based graphics options.
Three dimensional (3D) graphics support is provided by the DEC Open3D software. Contact your Digital sales representative for availability of the DEC Open3D software as a layered product for both the OpenVMS AXP and the DEC OSF/1 AXP operating systems.

If your system is running the OpenVMS AXP operating system, the two-dimensional (2D) graphics TURBOchannel option described in Table 1–1 is available.

In addition to the hardware three-dimensional (3D) graphics described in Table 1–1, there are also 3D software applications available for use on the OpenVMS AXP operating system. Two applications, DEC PHIGS (Programmer’s Hierarchical Interactive Graphics System) and DEC GKS (Graphics Kernel System) can be run as layered products. For more information, contact your Digital sales representative.

Integrated Services Digital Network (ISDN)

Note: ISDN Not Yet Available

Though your DEC 3000 Model 500X AXP system can provide ISDN capabilities, they are not yet agency approved or available. Currently, a plug has been placed in the ISDN port pending approval of ISDN licenses. Once agency approval of ISDN for the DEC 3000 Model 500X AXP system has been granted, you will be contacted by your Digital sales representative to inform you of the ISDN certification. At that point, you must remove the plug from the ISDN port before connecting the ISDN network.

The following information explains the ISDN capabilities for your DEC 3000 Model 500X AXP system pending license approval.

ISDN Capabilities

ISDN is a digital telecommunications network, providing connectivity for voice and data applications.

Your DEC 3000 Model 500X AXP system includes an ISDN Basic Rate S/T interface, which includes:

- two 64 kilobits per second B channels
- one 16 kilobits per second D channel

Use of ISDN B Channels

The B channels can be used for digitized voice and circuit-switched data at up to 64 kilobits per second, or for packet-switched data transmission.

Use of ISDN D Channels

The D channel uses a protocol standardized by the International Telegraph and Telephone Consultative Committee (CCITT) for setting up these connections. The D channel can also be used for low-speed packet transmission.
Audio Capabilities

Audio Overview

The DEC 3000 Model 500X AXP system features telephone-quality audio features, providing audio input and output capabilities. The audio ports are located on the front of the system unit, behind the front access door. Figure 1–2 shows the audio ports: the microphone input jack ①, the speaker/headphone jack ②, the telephone handset jack ③, and the audio input jack ④.

Figure 1–2 Audio Ports on the DEC 3000 Model 500X AXP

Port pin-outs for the telephone handset jack on the system unit are provided in Appendix B.
Audio Capabilities

**DECsound Application**

The DECsound application, shipped with your DEC 3000 Model 500X AXP workstation as part of the OpenVMS AXP DECwindows Motif layered product kit, is an easy-to-use software application that lets you play back recorded messages, record audio messages, mail recorded messages, and include recorded messages in compound documents.

**XMedia Application**

Audio support for DEC OSF/1 AXP systems is provided by XMedia, Digital's distributed multimedia software development environment.

**TURBOchannel Options**

There are a total of five TURBOchannel option slots on your system. Since your 2D graphics capabilities are integral to your system, you have all five TURBOchannel slots available for other options.

**Installing Internal Options**

For more information about internal and TURBOchannel options and how to install them in your DEC 3000 Model 500X AXP system, see the DEC 3000 Model 500X AXP Options Guide.

**External Options**

You can add one or more of the following external options to your system.

- A printer such as a PostScript laser printer.
- A modem
- A puck or stylus tablet
- A BA350 expansion box that can hold the following devices:
  - RZ2x-series fixed disk drives
  - TLZ06 DAT (digital audio tape) drive
  - RRD42 compact disc drive
  - TZK10 quarter-inch cartridge tape drive

**Adding External Options**

For more information about external options and how to add them to your DEC 3000 Model 500X AXP system, see the DEC 3000 Model 500X AXP Options Guide.

**Ordering Options**

Contact your Digital sales representative for more information about ordering DEC 3000 Model 500X AXP system options.
Preparing to Install the System

Chapter Overview

Introduction
Before you install your DEC 3000 Model 500X AXP system, you need to prepare your site, and familiarize yourself with your system hardware.

In This Chapter
This chapter covers the following topics:
• Choosing a Location
• Customizing Your Work Area
• Moving Your System
• Unpacking Your System
• A Closer Look at Your System
• Where to Go Next
Choosing a Location

Space Requirements

When choosing a location, consider the system measurements as shown in Figure 2–1, and allow 7.6 cm (3 inches) ventilation space between the system unit and the desk.

Figure 2–1 Dimensions of System

Monitor Requirements

When allocating space for your new DEC 3000 Model 500X AXP workstation, consider also the size of your monitor and the length of your monitor video cable.
Choosing a Location

### Location Requirements

Choose a location for your DEC 3000 Model 500X AXP system that meets the following requirements:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appropriate dedicated power source with an isolated ground</td>
<td>Power source must be 110–120 volts alternating current (VAC) or 220–240 VAC, used solely for system unit and monitor.</td>
</tr>
<tr>
<td>Moderate temperature</td>
<td>Room temperature should remain between 15°C and 32°C (59°F and 90°F).</td>
</tr>
<tr>
<td>Relative humidity</td>
<td>Relative humidity should range between 30 percent and 70 percent.</td>
</tr>
<tr>
<td>Ample circulation</td>
<td>Provide a minimum of three inches of clearance all around the workstation. This allows air to circulate around the workstation to prevent excess heat buildup and to keep the system air vents clean.</td>
</tr>
<tr>
<td>Working room</td>
<td>Leave enough room on your desktop for your keyboard, mouse pad, and any papers and materials that you may need.</td>
</tr>
</tbody>
</table>

### What to Avoid in a Location

When choosing a location for your workstation, try to avoid the following hazards:

<table>
<thead>
<tr>
<th>Hazard</th>
<th>How to Avoid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dust and dirt</td>
<td>Position the system unit in a clean, dust-free location. Dust and dirt damage system components.</td>
</tr>
<tr>
<td>Heat and sunlight</td>
<td>Do not place your DEC 3000 Model 500X AXP system in direct sunlight, close to a heater, or near a photocopier.</td>
</tr>
</tbody>
</table>
Ergonomic Considerations

Considering the ergonomics of your working environment before installing your system can help you to perform your job more effectively once you begin using your DEC 3000 Model 500X AXP system.

Comfort in your workplace can be achieved by making sure that your chair, monitor, keyboard, and mouse are set at the right height and distance for you and the work that you are doing, as shown in Figure 2–2 and explained in Table 2–1.

Moving Your System

Locate the Handle

The handle by which to move your system unit is located on the front, at the top, under the product medallion 1, as shown in Figure 2–3. Grasp this area firmly and pull the system unit towards you any time you wish to move it. The low-friction feet on the bottom of the pedestal allow the unit to be moved easily across the floor.

Figure 2–3  The DEC 3000 Model 500X AXP System Handle
CAUTION: Two People to Lift the System Unit

Two people are needed to lift the DEC 3000 Model 500X AXP system unit, which is quite heavy. The unit is designed to be lifted using the front handle 1 and the rear of the system unit at the top 2, as shown in Figure 2–4.

Do not attempt to lift the system unit from the bottom, as you may cause damage to the front or side panels, which are not designed to hold the weight of the system unit.

Figure 2–4 Lifting the DEC 3000 Model 500X AXP
Unpacking Your System

Your system arrives in two boxes, one for the system unit and accessories, the other for the monitor.

Before installing your system, check to see that you have all of the parts shown in Figure 2–5. The contents shown are for preconfigured systems. If you did not order a preconfigured system, check your packing slip to make sure that whatever you ordered has arrived in your shipment.

If you are missing any parts for your DEC 3000 Model 500X AXP workstation, contact your Digital sales representative immediately.

The DEC 3000 Model 500X AXP workstation and the monitor shipped with your system are both quite heavy. Have someone help you remove these items from the shipping boxes, as indicated on the packing cartons.

**For Users in Germany**

To comply with certain international standards, Digital includes German regulatory information (sometimes referred to as the FTZ card) in every system and monitor box. Disregard this material if your system is not located in Germany.

**For Users in Australia**

The yellow Austel warning label, part number 36-39563-01, attached to the shipping container and system unit, is required by the country of Australia for systems that provide ISDN functionality but are not yet certified for use in Australia. Disregard these labels if your system is not located in Australia.

Chapter Overview

Introduction
Your DEC 3000 Model 500X AXP workstation is designed to be installed quickly and easily. The information in this chapter explains how to connect the cables to the system unit and to the monitor, and how to prepare the DEC 3000 Model 500X AXP workstation for startup. Starting your workstation is explained in Chapter 5.

In This Chapter
This chapter covers the following topics:

• Before You Begin
• Task Overview
• Connecting the DEC 3000 Model 500X AXP Workstation
• System Unit Cover Lock
• Checking Your Installation
• Where to Go Next
Before You Begin

Before you install your system components, you should have already completed the following tasks:

- Determined any ergonomic considerations you may have.
- Chosen a location for your DEC 3000 Model 500X AXP workstation.
- Unpacked your DEC 3000 Model 500X AXP workstation.
- Familiarized yourself with the ports and controls on the rear of the system unit.

If you have not performed all of these tasks, do so now. They are covered in Chapter 2.

Note that:

- Installing your system requires little or no previous knowledge of computer systems. Connecting your DEC 3000 Model 500X AXP workstation should take about 15 minutes.
- This chapter covers connecting your DEC 3000 Model 500X AXP as a standalone workstation. You may connect your workstation to a network with a few minor adjustments to the procedures in this chapter. Chapter 4 explains how to connect to a network.
- The accessory bag shipped with your workstation includes parts that you do not need during installation. Save any terminators and additional parts in case you need them later.
Parts for Installation

Figure 3–1 lists the parts required to install your workstation.

Figure 3–1 Parts Needed to Install Your Workstation
Table 3–1 gives an overview of the steps involved in installing your DEC 3000 Model 500X AXP workstation system components.

Connecting the DEC 3000 Model 500X AXP Workstation

Step 1: Attach the Ethernet Loopback Connector

Attach the Ethernet loopback connector to the AUI Ethernet port on the system unit, as shown in Figure 3–2. If you plan to connect to an AUI Ethernet network or a ThinWire Ethernet network using a DECXM transceiver (or a DESTA unit), you may omit this step. After you have completed the connections in this chapter, see Chapter 4 for information about network connections.

Step 2: Connect the Keyboard/Mouse Extension Cable

Connect the keyboard/mouse extension cable to the keyboard/mouse port on the system unit, as shown in Figure 3–3.

Figure 3–3 Connecting the Keyboard/Mouse Extension Cable
Step 3: Connect the Keyboard Cable and Mouse Cables

Connect the keyboard cable and the mouse cable to the connector block on the keyboard/mouse extension cable 1, as shown in Figure 3–4. The extension cable is provided so that the mouse and keyboard can be located away from the system unit.

Figure 3–4 Connecting the Keyboard and Mouse to the Keyboard/Mouse Extension Cable

The Plastic Mylar Tab

To keep the keyboard/mouse extension cable in one location, you can place the plastic Mylar tab 2 on the connector block of the keyboard/mouse extension cable under the base of your monitor.

**Step 4: Attach the Universal Strain Relief Strap**

Attaching the universal strain relief strap to your monitor video cable can prevent the weight of the cable’s junction block from pulling the cables out of the connectors on the back of the monitor.

Attach the universal strain relief strap to the monitor video cable by performing the following tasks:

1. Insert the three BNC connectors 1 and cable junction block 2 of the video cable through the center slot of the universal strain relief strap 3, making sure the strap is under the cable junction block.

2. Pull the video cable into the slotted hole at the bottom end of the universal strain relief strap. Bring the strap flush with the cable junction block.

3. Align the green (G) BNC connector with the two keyslots of the closed hole at the top end of the universal strain relief strap, and snap the BNC connector into the hole.

Figure 3–5 shows a universal strain relief strap properly attached.

Step 5: Monitor Cables to Monitor

Complete the following steps to connect the monitor cables to the back of the monitor.

- Step 1 for a color monitor.
- Step 2 for a monochrome or greyscale monitor.
- Step 3 for all monitors. Table 3–3 shows the locations of the connectors on the backs of various monitors. Shaded areas indicate location of connectors.

Step 6: Connect the Monitor Video Cable

Connect the monitor video cable to the monitor port on the rear of the system unit, as shown in Figure 3–6.

Figure 3–6 Connecting the Monitor Video Cable
If there is a sticker similar to the one shown in Figure 3–7 covering the system power socket on the rear of the system unit, your system already has either the OpenVMS AXP or the DEC OSF/1 AXP operating system, factory-installed on an internal fixed disk.

Figure 3–7 Factory-Installed Software Sticker

When you are ready to start your system, refer to the OpenVMS AXP Factory Installed Software (FIS) User Information to start your OpenVMS AXP operating system, or to the DEC OSF/1 AXP Factory-Installed Software (FIS) User Information to start your DEC OSF/1 AXP operating system. One of these documents will be shipped with your system, depending on which operating system you have ordered.
Step 7: Connect the System Power Cord

Connect the system power cord to the DEC 3000 Model 500X AXP unit, as shown in Figure 3–8. The system power cord is the thicker of the two power cords shipped with your system, and is specially keyed to fit in the system power socket.

Figure 3–8 Connecting the System Power Cord to System
Step 8: Plug Cord Into Power Outlet

Make sure that the power On/Off switch is in the Off (O) position, and then plug the other end of the power cord into a power outlet of the correct voltage.

Step 9: Check the Video Refresh Switch

Check to make sure the video refresh switch on the system unit is set to the correct position, according to your monitor documentation's frequency refresh rate. For monitors that run at 72 Hz, the switch should be in the up, or two-dot position, as shown in Figure 3–9. For monitors that run at 66 Hz, the switch should be in the down, or one-dot position.

Figure 3–9  Checking the Video Refresh Switch
Step 10: Check the Alternate Console Switch

Check to make sure the alternate console switch on the system unit is set to the correct position, which is to the right when you are using a monitor, as shown in Figure 3–10.

Additional System Unit Security

Your DEC 3000 Model 500X AXP workstation comes with a cover lock on the system unit to provide additional security. The system is shipped with a set of two keys attached to the top cover of the system unit, as shown in Figure 3–11.

Figure 3–11  System Unit Cover Keys
### System Unit Cover Lock

**Recording the Serial Number of the Keys**  
If there is a serial number engraved on the system unit keys, record the number in case you lose the keys in the future. (See Figure 3–11.)  
Record the serial number of the cover lock keys here:

---

**What to Do if You Lose the Keys**  
If you lose the keys to your system unit cover lock, you will need to call your Digital service representative, as described in Chapter 13. Make sure that you have the keys’ serial number. If there were no serial numbers on the keys, provide this information to your Digital service representative.
To lock the DEC 3000 Model 500X AXP unit, insert the key and turn it clockwise, as shown in Figure 3–12.

Chapter Overview

Introduction
At some point, you may want to connect your DEC 3000 Model 500X AXP system to a network at your site. There are two parts to the task: making the hardware connections and establishing the networking software connection.

In This Chapter
This chapter describes how to complete the hardware connections to a network. For the networking software connection, see your system or network administrator at your site.

This chapter covers the following topics:
• Before You Begin
• Connecting to an AUI Ethernet Network
• Connecting to a 10BASE-T Network
• Connecting to a ThinWire Network
• Setting and Verifying the Network Connection
• Completing the Network Connection
Before You Begin

What You Should Do First

Before connecting your DEC 3000 Model 500X AXP system to a network, you need to:

1. Turn off your system if it is already on. See Chapter 6.
2. Determine the network type at your site.
3. Understand the network connectors on your system.
4. Obtain the correct Ethernet cables or connectors to connect to the appropriate network port on the rear of your workstation.
5. Obtain and register your network information, if necessary.

What You Should Know Beforehand

For the tasks described in this chapter, only basic hardware knowledge is desirable, as for the tasks you performed when you installed your system.

Determining Your Network Type

See your network administrator to find out the network type at your site. If there is more than one network, find out to which one you will be connecting your system.

Network Labels

For your convenience, network labels are shipped with your system. Use the network labels to record pertinent information about your system, such as the network node name and/or number. You can adhere the label to the front of your system behind the front access door on the front of the system. (See Figure 2–8 for the location of the front access door.)
Available Networks

You can connect three different types of networking cables to your DEC 3000 Model 500X AXP system:

1. AUI Ethernet
2. ThinWire Ethernet (by attaching a DECXM transceiver or a DESTA unit to the AUI Ethernet port)
3. 10BASE-T Ethernet
4. ISDN (Integrated Services Digital Network), when available. See Chapter 1 for a description of the ISDN services and availability.

Network Cables and Adapters

Once you determine your network type, be sure that you have the cables and connectors listed in Table 4–1 before trying to connect your system to a network.

Registering Network Information

All networks require you to register network information, such as a node name and number. You must complete this task before you can start using your system on the network. See your system or network administrator for assistance.
Connecting to an AUI Ethernet Network

Procedure

Overview

To connect your DEC 3000 Model 500X AXP system to an AUI Ethernet network, sometimes referred to as thickwire or standard Ethernet, complete the steps in Table 4–2.

<tr>
<td>2</td>

</tr>
</tbody>
</table>

Step 1: Loopback Connector

If the loopback connector is still connected to your system, remove it now. Keep the loopback connector in a safe place. You may need it later for testing purposes.

Step 2: AUI Ethernet Cable

Connect the AUI Ethernet cable (BNE4C-xx) to the AUI port on the rear of the system unit as shown in Figure 4–1. Be sure to attach the cable securely.
Step 3: Sliding Lock

Push the sliding lock on the AUI Ethernet cable connector up, using your finger. The sliding lock prevents the cable from becoming disconnected.

Connect the other end of the cable to the AUI Ethernet network transceiver or DELNI unit.
Connecting to a 10BASE-T Network

Procedure

Overview

To connect your DEC 3000 Model 500X AXP system to a 10BASE-T network, sometimes referred to as a twisted-pair network, complete the following tasks.

1. Connect the 10BASE-T cable to the 10BASE-T port on the back of the system unit as shown in Figure 4–2, making sure that the cable is attached securely.

2. Connect the other end of the cable to the network connection.

ThinWire Ethernet Connection Procedure

You can connect your DEC 3000 Model 500X AXP system to a ThinWire Ethernet network by attaching an Ethernet cable (BNE4C-xx) to the AUI Ethernet port on the system unit, and then attaching a DECXM transceiver (or a DESTA unit) to the cable.

To connect your DEC 3000 Model 500X AXP to a ThinWire Ethernet network, complete the steps listed in Table 4–3.

Step 1: Loopback Connector

If the Ethernet loopback connector is still connected to your system, remove it now. Keep the loopback connector in a safe place. You may need it for testing purposes later.

**Step 2:**
*Ethernet Cable*

Connect an AUI Ethernet cable to the AUI port on the rear of the system unit, shown in Figure 4–1 of this chapter.

**Step 3:**
*DECXM Transceiver or a DESTA Unit*

Connect the other end of the AUI Ethernet cable to the AUI port on the DECXM transceiver ①, or a DESTA unit ②, as shown in Figure 4–3.

**Figure 4–3 Connecting the AUI Ethernet Cable to the DECXM Transceiver or a DESTA Unit**

Step 4: ThinWire Cables and T-Connector

Connect the ThinWire network cables to the T-Connector and then the T-connector to the DECXM transceiver ①, or a DESTA unit ② unit, as shown in Figure 4–4.

Figure 4–4 Connecting the ThinWire Cables and T-Connector to the DECXM Transceiver or a DESTA Unit

Step 5: Terminate Connection

If your workstation is the last one on a ThinWire network, you need to terminate the network connection. Do this by connecting a terminator, rather than a ThinWire network cable, to one side of the T-connector on the DECXM transceiver ①, or a DESTA unit ②, as shown in Figure 4–5.

For information on correct settings for your DECXM or DESTA unit, refer to Table 4–4 for documentation shipped with the units.

</tbody>
</table>
After completing the hardware network connections to your DEC 3000 Model 500X AXP system, you must complete the following tasks:

1. Set the network connection type.
2. Verify the network connection.

There are two network settings recognized by your system—THICK (for an AUI Ethernet or a ThinWire Ethernet network), and TENBT (for a 10BASE-T network). The default setting is THICK. See Table 4–5 for the network setting you should use.

</tr>
<tr>

<td>TENBT</td>
</tr>
</tbody>
</table>
Setting the Network Type

You set the network type from console mode. To set the network type, complete the following steps:

1. Start your system as Chapter 5 describes.

2. If your system does not stop at the console prompt after the startup tests, press the halt button on the front of your system unit to display the console prompt (>>>). See Figure 2–8 for the location of the halt button.

3. Enter the following command and press the Return key:

   ```
   >>> set ethernet network_type
   ETHERNET = network_type
   ```

   The variable `network_type` is either THICK or TENBT, depending on which network you are using.

Verify the Network Connection

Once you have set the network type, you can verify the network connections by entering the `test ni` command at the console prompt as follows. The `test ni` command tests the Ethernet network interface (NI).

```
>>> test ni
```

Successful Result of test ni

If the `test ni` test is successful, you will see a display similar to the following:

```
>>> test ni
T-STS-NI - OK
```

Error Detected During test ni

If the network test detects an error, you will see a display similar to the following:

```
>>> test ni
T-ERR-NI - Ext Lpbk test failed
?? 000 NI 0x00f2
   84 FAIL
```
Setting and Verifying the Network Connection

If there is an error message, check to make sure the cable is connected securely to the system unit, or see Chapter 12 for more information.

Restarting Your Operating System

To restart your operating system, enter the `boot` command at the console prompt as follows:

```plaintext
>>> boot  [Return]
```

This is the default command to start your operating system from the disk that was shipped with your system.

If you have modified the default startup procedure by changing the environment variables (described in Chapter 9), enter the appropriate `boot` command for your system.

Completing the Network Connection

Contact Your Network Administrator

Once you determine that your network cables are connected securely, and your system starts up and tests without errors, contact your network administrator to configure your DEC 3000 Model 500X AXP workstation as part of your network.

If your system displays any error messages during the startup test, see Chapter 12 to determine the problem.
Chapter Overview

Introduction
Once you have installed your DEC 3000 Model 500X AXP workstation, and optionally connected to a network, you are ready to start the system.

In This Chapter
This chapter covers the following topics:
• Before You Begin
• Turning On the DEC 3000 Model 500X AXP System
• Reviewing the Startup Display
• Starting a System with Factory-Installed Software
• Loading Operating System Software
• Where to Go Next
Before You Begin

What You Should Have Done Already
Before you start up your system, you should have already completed the following tasks:

- The installation tasks described in Chapter 3.
- The network connection steps described in Chapter 4 if your system is to be networked.

If you have not performed these tasks, do so now.

What You Should Know Beforehand
The tasks in this chapter require some experience with computer tasks such as turning on the power switch, entering console commands, and responding to questions that appear on-screen during the factory-installed software procedures.

Factory-Installed Software
Preconfigured systems with an internal fixed disk drive include a factory-installed operating system.
Whenever you turn your system on, always turn on the system unit last.

For example, if your system has a monitor or an expansion box connected to it, turn on the units in this order:

1. Monitor
2. Expansion box
3. System unit

By turning on your system components in the correct order, your DEC 3000 Model 500X AXP system will detect all connected devices.

CAUTION: System Unit Cover

If you have removed the system unit cover for any reason, be sure to replace it on the system unit and close it securely before turning on the system. It is important that the system unit cover and side panels be in place while the system is operating to ensure proper cooling of the system components and devices.
# System Startup Procedure

To start up the DEC 3000 Model 500X AXP workstation system, perform the steps in Table 5–1.

<tbody>
<tr>

<tr>
<td>3</td>
<td>Turn the On/Off switch ① on the front of the system unit to the On (</td>
</tr>
</tbody>
</table>

The power indicator light ② on the front of the system unit lights if the system has started up successfully.

If the power light does not come on, or the fan failure light ③ comes on, see Chapter 12.

# What You Should See on a Workstation

When you turn on your workstation monitor and then the system unit, you should see the graphics option diagnostic startup tests displayed on the monitor screen. During this time the monitor display will flash colors (if you have a color monitor), and/or change patterns for a few seconds.

Loading Operating System Software

No Factory-Installed Software
If your system was not preconfigured with an internal fixed disk drive, you do not have factory-installed software on your system. To install the operating system, you must start your system and load your operating system software from a compact disc. Instructions for handling and using compact discs are included with the operating system software.

Loading the Operating System
Loading your operating system software from a compact disc requires specific operating system instructions. These instructions are available in the documents listed in Table 5–4. These documents are included with your operating system software shipment.

In This Chapter

This chapter covers the following topics:

• Before You Begin
• Task Overview
• Shutting Down the System
• Halting the System
Before You Begin

What You Should Do First

Before turning off your system, determine the current status of your system, as Table 6–1 describes.

What You Should Know Beforehand

Shutting down your system may require knowledge of file backup and operating system shutdown procedures.

The following privileges may also be required:

- For the OpenVMS AXP operating system, the shutdown procedure usually requires certain software privileges
- For the DEC OSF/1 AXP operating system, you may require superuser privileges to shutdown the system

If you do not have the required system privileges, ask your system manager for assistance in this task.
Task Overview

System Shutdown Steps

Table 6–2 gives an overview of the steps involved in shutting down your DEC 3000 Model 500X AXP system.

Shutting Down the System

Step 1: Shut Down Operating System

If your system is connected to a network or is part of a cluster, be sure to contact your system manager for further instructions before shutting down the operating system on your system.

Refer to the documentation in Table 6–3 for information about the operating system shutdown procedure:

</table>
Shutting Down the System

**Step 2: Turn Off the Hardware**

After shutting down the operating system software, you can turn off the hardware by completing the following steps.

1. Turn off (O) the system unit by pressing the On/Off switch, Figure 6–1.
2. Turn off (O) all expansion boxes.
3. Turn off (O) all peripheral devices (such as printers and modems).
4. Turn off (O) the monitor.

**Figure 6–1  Turning Off the System Unit**
Halting the System

When to Halt the System

While turning off the hardware usually requires that you first run the operating system shutdown procedures, it may be necessary to halt your system for other reasons. Halting the system returns control from program mode (operating system) to the console mode, and displays the console prompt (>>>).

Table 6–4 describes when to halt the system.

Halting the System

**Pressing the Halt Button**

To halt the system, locate the halt button on the front of the system unit, press it once and release it, as shown in Figure 6–2.

**Figure 6–2  Pressing the Halt Button**
Halting the System

**System Halt Display**

When you press the halt button, you may see a system halt message similar to the one shown in Figure 6–3.

**Figure 6–3  System Halt Message**

```
>>> ?02 EXT HLT
    PC= 00000000.20000000  PSL= 00000000.00001F00
```

This message indicates that the halt button has been pressed. It does not signify an error. Note that a halt message is not always displayed.

If you have halted your system to access console commands, you can continue now.

**Screen Display When You Halt a Workstation**

If you press the halt button on a workstation system running DECwindows Motif with the OpenVMS AXP operating system, the console prompt appears in the top left-hand corner of the screen. Approximately four lines of console information are displayed at a time. The remainder of the screen continues to display the DECwindows Motif session.

**Console Commands You Can Issue**

You can use only the following commands when your system is halted while running the OpenVMS AXP operating system:

- `continue`, to exit from console mode and return to the operating system
- `help`
- `help advanced`
- `help mips_emulator`
- `help set`
- `help show`
- `printenv`
- `set`
- `show`

Using other console commands may affect memory contents and thus prevent the system from being able to return to the operating system.

Returning to Program Mode

To return to program mode of your operating system, enter the continue command as follows:

>>>continue  *Reset*

Press the [Ctrl] and [F2] keys to remove the console display area from the top of your screen and return to a full DECwindows Motif display.
Chapter Overview

Introduction

While your DEC 3000 Model 500X AXP system is designed to function in a range of environmental conditions, it is an electrical device that should be treated with care and maintained properly.

Correct use and maintenance of your system unit, monitor, keyboard, and mouse not only ensures that the system functions properly, but also helps avoid more serious problems that could cause permanent damage.

In This Chapter

This chapter covers the correct use and maintenance of your DEC 3000 Model 500X AXP system, but does not cover the maintenance that your Digital service representative can perform. The following topics are included:

• Before You Begin
• Maintaining the System Unit and Keyboard
• Cleaning the Monitor
• Cleaning the Mouse
• Removing the Front Access Door
Before You Begin

Before performing any maintenance tasks, take these steps:

1. Complete the tasks outlined in Chapter 6 to turn off your system.
2. Prepare any cleaning materials you may need.

You can then complete your system maintenance tasks.

Maintaining the System Unit and Keyboard

Caring for the System Unit

The DEC 3000 Model 500X AXP system unit requires adequate ventilation. Ideally, the system unit should be positioned in as dust-free an environment as possible. Also, never position the system unit in direct sunlight where it may become too hot.

Clean your system regularly by wiping dust and particles from the system unit and the keyboard with a soft cloth.

CAUTION: Food and Liquid

Do not place food or liquid on or near your DEC 3000 Model 500X AXP system.
### Liquid on the System Unit

If you inadvertently spill liquid on the system unit and it goes inside, turn off the system as soon as possible and contact your Digital service representative as indicated in Chapter 12.

### Accidental Spills on the Keyboard

While care should be taken not to spill food or liquid on the system unit or the keyboard, follow these steps if you spill water on the keyboard:

1. Unplug the keyboard from the system unit.
2. Wipe up the excess water immediately.
3. Turn your keyboard over to drain any remaining water.
4. Leave the keyboard to dry on its own for several hours before connecting it to your system again.

If the keyboard does not work correctly when you reconnect it, contact your Digital service representative, as described in Chapter 12.

If you spill something like a carbonated drink, tea, or coffee on the keyboard, disconnect the keyboard from the system unit and call your Digital service representative immediately.
Cleaning the Monitor

Cleaning Procedure

To clean the monitor screen, follow these steps:

<table>

Before You Begin

What You Should Do First

Before using any console commands, you should complete these tasks:

- Put your system in console mode. If your system is not displaying the >>> prompt, refer to Chapter 6 to shut down your operating system and/or halt your system.

- Read this entire chapter before continuing.

What You Should Know Beforehand

Using console commands requires at least an intermediate, and sometimes advanced, knowledge of your system and its components, and the effect that console commands can have on your system.

CAUTION: Control of System Devices

Console commands control system devices and memory. Do not use console commands without fully understanding the effect that they can have on your DEC 3000 Model 500X AXP system.

For instance, some advanced-level commands, such as deposit and set, let you manipulate nonvolatile and system memory. Using the deposit command to place a value in a location of memory containing the actual console firmware could either hang the system or prevent it from restarting after it was powered off.

If you are not sure about using console commands, ask your system manager for help.

Advanced Console Command Information

This document does not describe all console commands, especially those commands requiring extensive technical knowledge. For a complete description of all console commands and how to use them, see the DEC 3000 Model 500X AXP Service Documentation Kit.
Two Modes of Operation

Your DEC 3000 Model 500X AXP can run in either of two modes:

1. Console mode
2. Program mode

Console Mode: Definition

In console mode, the system operates under the control of the console subsystem, rather than the operating system. All user input is passed directly to the console.

Console mode is in effect when the system is turned on and the operating system software has not been started, or has been interrupted, by pressing the halt button, for example.

Program Mode: Definition

In program mode, the system and console are under control of the operating system. All user input is passed to the operating system. You cannot issue console commands without returning to console mode.

Program mode is in effect when the system is turned on and the operating system software has started. In program mode, the user can manage the system, run software applications, and perform network tasks.

When Console Mode is Used

By definition, you will interact directly with the console subsystem under the following circumstances:

- Before booting the operating system software
- While setting environment variables (see Chapter 9)
- When using the Firmware Update Utility (see the DEC 3000 and DEC 4000 AXP Firmware Release Notes for more information)
- When trying to identify and resolve system problems or errors (see Chapter 12)
## Console Mode User Interface

### Console Interface Components

The console mode user interface is made up of the following elements:

- Console prompt
- Special keys and control characters
- Console commands

### Console Prompt

The console mode prompt looks like this:

```>>>
```

You can enter control characters and console commands at the console prompt.

### Console Mode Keys and Control Characters

Control characters are entered by holding down the key labeled Ctrl while pressing another key, for example, `Ctrl/C`.

Table 8–1 lists the keys and control characters that you can use while operating in console mode.
### Table 8–1 Supported Keys and Control Characters

The boot Command

Description

The `boot` command initializes the system and starts the boot program, which loads and starts the operating system software.

Command Syntax

Issue the `boot` command using the following syntax:

```bash
>>> boot <-flags> <-filename> boot_device
```

Command Description

The `boot` command and its parameters are described in Table 8–4.

Table 8–4 Boot Command Parameters/Qualifiers

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Specified as</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-flags</td>
<td>-fl &lt;value&gt;</td>
<td>ASCII string of up to 23 characters.</td>
</tr>
<tr>
<td>-filename</td>
<td>-fi &lt;filename&gt;</td>
<td>A filename of up to 23 characters, used when booting across a network device to specify the name of a file to load into the system.</td>
</tr>
<tr>
<td>boot_device</td>
<td>Device name, such as DKA200</td>
<td>A device from which the system attempts to boot.</td>
</tr>
</tbody>
</table>

Default Boot Flags

If you do not use the `-fl` and `-fi` parameters with the `boot` command, the system uses the default boot flag values (0, 0).

Information about using boot flags is provided in your operating system documentation:

</tr>
</tbody>
</table>
The boot Command

Overriding the Default Boot Flag Value

You can override any current default settings by specifying a parameter with the `boot` command, for example:

```bash
>>> boot -fi "myboot.com"
```

The parameter you specify overrides any current default settings, but does not change the default values stored as environment variables. See Chapter 9 for information about changing environment variables.

Boot Device Naming Conventions

You can specify the boot device name in two ways, using either an OpenVMS- or a DEC OSF/1-style device name. Table 8–5 provides a list of the device naming conventions, which can be used for the boot command in either operating system. The command syntax is described in the example `boot` commands that follow Table 8–5.

</tr>
</tbody>
</table>

For operating system-specific information about how to use the `boot` command, see your operating system documentation. Refer to Table 5–4 for more information.
The boot Command

Example: OpenVMS AXP boot Command

The following example indicates the command to boot the OpenVMS AXP operating system without any flags from a fixed disk drive:

>>> boot dka100

The device name elements in this boot command are defined as follows:

- **dk**–the device type, in this instance an internal fixed disk drive
- **a**–the SCSI device controller (could be a or b)
- **100**–the SCSI ID number

Example: DEC OSF/1 AXP boot Command

The following example indicates the command to boot the DEC OSF/1 AXP operating system without any flags from an internal fixed disk drive:

>>> boot rz1a

The device name elements of the OSF/1-style boot command are defined as follows:

- **rz**–the device type, in this instance an internal fixed disk drive
- **1**–the SCSI ID number (unlike the OpenVMS-style command, only the single digit number is used, such as 1 rather than 100)
- **a**–the SCSI device controller (could be a or b)
The continue Command

Description

The continue command returns the system to operating system level after console mode has been invoked.

DEC OSF/1 AXP Operating System

This command is not applicable for systems running the DEC OSF/1 AXP operating system. You can halt the system, enter console commands, and then return to program mode using the continue command only on systems running the OpenVMS AXP operating system.

Command Syntax

Issue the continue command as follows:

```plaintext
>>> continue
```

Your operating system should resume execution after you enter this command, providing that the contents of memory used by the operating system have not been altered or corrupted. Commands that can corrupt or alter system memory include the test, init, and deposit commands.

The halt Command

Description

The halt command halts the system. There are no parameters associated with this command.
The halt Command

**Command Syntax**

Issue the `halt` command as follows:

```plaintext
>>> halt
```

The system halts and the following message displays:

```plaintext
?2E HLTD
```

The help Command

**Description**

The `help` command displays a brief list of console commands, parameters, and qualifiers. You can specify one of the following topics with the `help` command, to display specific information:

- `help mips_emulator`
- `help set`
- `help show`

**Command Syntax**

Issue the `help` command as follows:

```plaintext
>>> help

Your system displays a list of topics similar to the following:

```plaintext
BOOT
HELP ADVANCED
INITIALIZE
SET[ENV] <envar> <value>
SHOW | PRINTENV [<envar>]
TEST
```
The help Command

**Command Example**

The following command indicates how to obtain help on the `show` command:

```plaintext
>>> help show
```

The system responds with the following display:

```
PRINTENV | SHOW | AUTO_ACTION | BOOTOPT_DEV | BOOOT_OFSLAGS |
         | BOOT_RESET | CONFIG | DEVICE |
         | DIAG_LOE | DIAG_QUICK | DIAG_SECTION |

The `help advanced` command displays a list of all help topics available, including advanced console commands, parameters, and qualifiers.

**Command Syntax**

Issue the `help advanced` command as follows:

```plaintext
>>> help advanced
```
The help advanced Command

- `TEST <devnam> [ <tstnam> ]`

The set or setenv Command

**Description**

The `set` or `setenv` command lets you set an environment variable.

**Command Syntax**

Issue the `set` or `setenv` command as follows:

```plaintext```
>>> setenv environment_variable
```

The `environment_variable` parameter can be any of the environment variables listed in Table 9–1. Setting the password environment variable is described in Chapter 10.

**Command Example**

See Chapter 9 to see how to use the `set` command to change environment variables.
The show or printenv Command

Description

The `show` or `printenv` command provides information about the current setting for one or all environment variables. Entering the `show` or `printenv` without a parameter displays a list of all current environment variable settings.

Command Syntax

Issue the `show` or `printenv` command as follows:

```plaintext
>>> show variable_name
```

In the command above, `variable_name` can be any of the environment variables described in Chapter 9.

Command Example

To show the current setting for the `auto_action` environment variable, enter the following command:

```plaintext
>>> show auto_action
```

The system responds with the following information:

```
AUTO_ACTION=HALT
```n

Information about the `show` command is also provided in Chapter 9.
The test Command

The test Command

Command Description

The test command lets you run diagnostic tests on the components listed in Table 8–6:

Command Syntax

Issue the test command as follows:

```>>> test component [Default]```

where component is any of the components listed previously. If you issue the test command without specifying a component, the system will test all components. For more information about the test command, see Chapter 13.
Chapter Overview

Introduction
Environment variables are firmware parameters that can be changed to suit your specific system needs. You set environment variables while your system is in console mode. Your system is shipped with default values set for all available environment variables. The environment variable settings include the following startup information:

• The device from which your system boots
• The default startup action each time your system is turned on or a halt instruction is executed by software
• The language used in console mode

This chapter describes the available environment variables and how to display or change the current settings.

In This Chapter
This chapter includes the following topics:

• Before You Begin
• Available Environment Variables
• Displaying Current Environment Variables
• Changing the Default Startup Action (auto_action)
• Changing the Default Boot Device (bootdef_dev)
• Changing the Default Diagnostic Startup Mode (diag_quick)
• Changing the Default Keyboard Language (language)
Before You Begin

What You Should Do First

Before changing any environment variables, you should complete these tasks:

• Put your system in console mode. If your system is not displaying the >>> prompt, refer to Chapter 6 to shut down your operating system, and/or halt your system.

• Read Chapter 8 and the rest of this chapter before continuing.

What You Should Know Beforehand

Changing environment variables requires an understanding of what each of the environment variables does, and how changing the defaults will affect your system. Do not change any environment variable without fully understanding the effect that the change may have on your DEC 3000 Model 500X AXP system.

If you are not sure about changing environment variables, ask your system manager for help.

Available Environment Variables

Table 9–1 describes the DEC 3000 Model 500X AXP system environment variables and their default values. Information about environment variables not documented in this chapter or in Chapter 10 can be obtained via the help advanced command, or in the DEC 3000 Model 500X AXP Service Documentation Kit.

Using the show Command

You can use the show command to display one or all of the environment variables in Table 9-1.

Displaying Current Environment Variable Values

To display a list of the current values for all environment variables, enter the show command as follows and press the Return key.

```plaintext
>>> show
AUTO_ACTION = BOOT
BOOTDEF_DEV = {null}
BOOT_OSFFLAGS = 0,0
ENABLE_AUDIT = ON
BOOT_RESET = ON
SCSI_RESET = 4
DIAG_LOE = OFF
DIAG_QUICK = OFF
DIAG_SECTION = 1
ETHERNET = 08-00-2B-10-07-29, THICK
LANGUAGE = 3
MOP = ON
SECURE = OFF
RADIX = 0
SCSI_A = 7
SCSI_B = 7
SERVER = OFF
TRIGGER = OFF
```

You can change any of the environment variables with the set or setenv command.
Changing the Default Startup Action (auto_action)

Description

The `auto_action` environment variable determines the default startup action—the action the console takes any time the system is halted by software (not by pressing the halt button) or turned on.

Available Settings for `auto_action`

Table 9–2 lists the three different startup actions you can specify for the `auto_action` environment variable and the command parameters to use for each. Note that the parameter can be either a word, such as `boot`, or a corresponding number, such as `2`.

<table>
<thead>
<tr>
<th>Startup Action</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart. Boot automatically when system is turned on or following a software halt instruction.</td>
<td>restart or 1</td>
</tr>
<tr>
<td>Boot. Boot automatically only when system is turned on.</td>
<td>boot or 2</td>
</tr>
<tr>
<td>Halt. Halt at the console prompt (&gt;&gt;&gt;) when system is turned on or following a software halt instruction.</td>
<td>halt or 3</td>
</tr>
</tbody>
</table>
Changing the Default Startup Action (auto_action)

Default Setting
The default setting for the auto_action environment variable depends on whether your system is preconfigured at the factory with factory-installed software. All preconfigured systems are set to BOOT, all other systems are set to HALT.

Command Syntax
To set the auto_action environment variable, enter the following command:

```plaintext
>>> set auto_action parameter
```

Enter the parameter of your choice from Table 9-2 to set the default startup action.

Command Example
This command sets the default startup action to halt at the console prompt each time your system is turned on. The system responds with a confirmation of the action you have chosen.

```plaintext
>>> set auto_action 3
AUTO_ACTION = HALT
>>> return
```
Changing the Default Boot Device (bootdef_dev)

**Description**

The `bootdef_dev` environment variable determines the default boot device, or devices, from which the system attempts to boot. The system boots from the default boot device each time it is turned on (if `auto_action` is set to boot or restart), or each time the user enters the `boot` command.

**Available Settings**

You can set the `bootdef_dev` environment variable to any appropriate device or devices on your system.

**Boot Device Naming Conventions**

You can specify the boot device name in two ways, using either an OpenVMS- or a DEC OSF/1-style device name. Table 9–3 provides a list of the device naming conventions, which can be used for the boot command in either operating system. For a description of the boot device name elements, see Chapter 8.

</tr>
<tr>
<td>ES</td>
<td>ES</td>
</tr>
<tr>
<td>N/A</td>

</tr>
</tbody>
</table>

**Default Setting**

The default setting for the `bootdef_dev` environment variable is set at the factory to boot from the internal fixed disk drive that has been loaded with factory-installed software.
Changing the Default Boot Device (bootdef_dev)

**Command Syntax**

To set the bootdef_dev environment variable, enter the following command:

```bash
>>> set bootdef_dev device (Return)
```

Enter the device from which you want your system to boot. If you do not know which devices your system contains, enter the show device command as the next section explains.

**Listing Available Devices**

To see a list of devices installed in your system, issue the show device command at the console prompt and press the Return key. The system responds with a display similar to the one shown in Figure 9–1.

**Figure 9–1 The show device Display**

```bash
>>> show device (Return)

**Understanding the show device Display**

The show device command displays several columns of information. The sample show device display indicates that there is one RZ26 with device name DKA0 and three RZ25 devices with device names DKA100, DKA200, and DKA300 installed in the system. For a complete description of the show device command, see Chapter 13.
### Command Example Using a Device List

You can set the `bootdef_dev` environment variable so that the system tries to boot from a list of devices, rather than from a single device.

To set the `bootdef_dev` environment variable to a list of devices, enter a command similar to the following, substituting your system's boot device names:

```bash
>>> set bootdef_dev dka100,esa0
```

In this instance, the system would first try to boot from the drive called dka100. If that drive was unavailable, or the boot failed, the system would then try to boot from a remote device across an Ethernet connection (esa0).

### Changing the Default Diagnostic Startup Mode (diag_quick)

#### Description

The `diag_quick` environment variable determines the diagnostic test mode. The system enters the diagnostic test mode each time the system is powered on.

#### Available Settings

You can set the `diag_quick` environment variable to on or off:

- **on** to perform quick diagnostic tests of TURBOchannel devices
- **off** to perform normal diagnostic tests of TURBOchannel devices

#### Default Setting

The default setting for the `diag_quick` environment variable is `off`, so that normal diagnostic tests of TURBOchannel devices are performed at each system startup.
Changing the Default Diagnostic Startup Mode (diag_quick)

**Command Syntax**

To set the `diag_quick` environment variable, enter the following command. The system responds as shown.

```plaintext
>>> set diag_quick on
DIAG_QUICK = ON
```

Using the `on` parameter changes the default setting.

---

Changing the Default Keyboard Language (language)

**Description**

The `language` environment variable sets the console keyboard layout to one of sixteen available languages. This command is applicable only for a DEC 3000 Model 500X AXP workstation.

**Available Settings for language**

You can set the `language` environment variable to any of the supported languages.

**Default Setting**

The default setting for the `language` environment variable is English.

**Command Syntax**

To set the `language` environment variable, enter the following command:

```plaintext
>>> set language
```
Changing the Default Keyboard Language (language)

Command Example

The system displays a list of languages, each with a designated number. To set the language environment variable to Svenska, for example, you would enter 14 as shown in the example.

```plaintext

Chapter Overview

Introduction
The DEC 3000 Model 500X AXP system password security feature lets you prevent unauthorized personnel from accessing privileged console commands system.

In This Chapter
This chapter covers the following topics:
• Before You Can Use This Chapter
• Before You Begin
• Task Overview
• Entering a Password
• Enabling System Security
• Forgetting the Password
• Disabling or Changing the Password
Before You Can Use This Chapter

Important:
Secure Console Mode

In order to use the password security feature, your system must be in secure console mode, with the secure system jumper inside the system unit enabled. Your DEC 3000 Model 500X AXP system is shipped from the factory with this secure system jumper disabled. You must contact your Digital service representative to have the jumper enabled. See Chapter 13 for information on how to contact your Digital service representative.

Note: No Functionality

Please note that none of the functionality of the password security feature will be available until your system is set to secure console mode. Once your system has been set to secure console mode by your Digital service representative, you can proceed with this chapter.
Before You Begin

What You Should Do First
Before using the password security feature, you should complete the following tasks:

- Put your system in console mode. If your system is not displaying the >>> prompt, refer to Chapter 6 to halt your system.
- Read Chapter 8 and this chapter before continuing.

What You Should Know
Using the password security feature requires an intermediate knowledge of your system, and it is advised that you have some level of software experience. Do not use the password security feature without fully understanding the effect that the change may have on your DEC 3000 Model 500X AXP system. Using console commands incorrectly could lock you out of your system. Make sure that you note your password once you have set it.

If you are not sure about using the password security feature, ask your system manager for help.

When to Use the Security Feature
If the password security feature is not enabled, whenever a user enters console mode, he or she can use all of the privileged console commands, such as halt, set, deposit, and boot. By using the password security feature, you can restrict access to these key console mode functions.

Privileged Commands
Once you invoke the password security feature, certain console commands become privileged—you can issue these commands only if you use the password when you enter the login command at the console prompt.

In general, any commands that modify memory and registers, or that transfer CPU control from the console monitor to another program, such as boot or start, are considered privileged commands.
Before You Begin

List of Privileged Commands

Table 10–1 lists both privileged and nonprivileged console commands.

<table>
<thead>
<tr>
<th>Privileged Commands</th>
<th>Nonprivileged Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot (with parameters)</td>
<td>boot (with no parameters)</td>
</tr>
<tr>
<td>deposit</td>
<td>login (to allow password entry to the privileged state)</td>
</tr>
<tr>
<td>examine</td>
<td>continue (if you inadvertently push the halt button, this command lets you continue operations in a nonprivileged mode)</td>
</tr>
<tr>

<td>help</td>
</tr>
<tr>

</tr>
<tr>
<td>show</td>
<td>-</td>
</tr>
<tr>
<td>start</td>
<td>-</td>
</tr>
<tr>

<td>-</td>
</tr>
</tbody>
</table>

Continuing Privileged Access

Access to privileged console commands continues until you leave the console mode by using the boot, continue, halt, or start commands. You can then enter the privileged mode only by using the 16-character password.
Task Overview

Steps to Making the System Secure

Making your DEC 3000 Model 500X AXP system secure requires software and hardware tasks. Table 10–2 describes the steps required to secure your system.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Enter a password</td>
</tr>
<tr>
<td>2</td>
<td>Enable security</td>
</tr>
<tr>
<td>4</td>
<td>Log in to the system</td>
</tr>
</tbody>
</table>

Each of these tasks is described in this chapter.

Entering a Password

Enter a New Password

When your system arrives from the factory, the password security feature is not enabled and no password has been entered in the system. The password you enter must be a character string of exactly 16 hexadecimal characters (0 through 9, A through F). To enter a password on your system, enter the commands shown in Table 10–3, starting at the console prompt.
### Entering a Password

#### Table 10–3  Entering a Password

<table>
<thead>
<tr>
<th>Enter this command:</th>
<th>System responds...</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;&gt;&gt; set password</td>
<td>PSWD1&gt;</td>
</tr>
<tr>
<td>PSWD1&gt; new_password [Return]</td>
<td>PSWD2&gt;</td>
</tr>
<tr>
<td>PSWD2&gt; new_password [Return]</td>
<td>&gt;&gt;&gt;</td>
</tr>
</tbody>
</table>

As you enter the password, what you type does not display on the screen. If the two passwords you entered match, your password is preserved in nonvolatile memory, which means that the system saves your password value even when the system unit is turned off.

#### If You Make an Error

If the two passwords you enter do not match, the console aborts the password command and displays the following error message:

```
? 30 ILL PSWD
```

#### Note Your Password

Be sure to make a note of your password and store it in a secure place. If you forget your console mode password, see Forgetting the Password later in this chapter, or call your Digital service representative to regain access to the privileged console mode.
Once you have entered and confirmed your password, you must enable the password security feature by following the steps listed in Table 10–4.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Check the current status of the password security feature by entering the `show secure` command at the console prompt as follows:  

```plaintext
>>> show secure
SECURE = OFF
```

A zero response indicates that the password security feature is not enabled. |
| 2    | Enable the password security feature with the following command:  

```plaintext
>>> set secure on
```

The system responds with the following display:  

SECURE = ON
Forgetting the Password

If you forget your password, you must complete the steps in Table 10-5 to erase your password and regain access to your system.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Make sure the secure system jumper is in the disabled position. See Chapter 13 for information on how to contact your Digital service representative to have him perform this task.</td>
</tr>
<tr>
<td>2</td>
<td>Enter the deposit command as explained in the next section.</td>
</tr>
</tbody>
</table>

To erase the current password, enter the deposit command with the exact parameters shown. There is no system response to this deposit command.

```bash
>>> deposit /u/q-n:2 1E0200088 0 Return
```

Once your password is erased, you can enter a new password as explained in the section Entering a Password earlier in this chapter.
Disabling or Changing the Password

Disabling the Password

To disable the password security feature, enter the `login` command and your password. Then enter the following command at the console prompt:

```plaintext
>>> set secure off
```

The system responds with the following display:

```
SECURE = OFF
```

Changing the Password

To change the password, enter the commands listed in Table 10–6. Note that passwords must be exactly 16 digits in length and use the values 0 through 9 or A through F. Alphanumeric passwords are not accepted as console passwords.

<table>
<thead>
<tr>
<th>Enter this command:</th>
<th>System responds...</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;&gt;&gt; set password</td>
<td>PSWD0&gt;</td>
</tr>
<tr>
<td>PSWD0&gt; old_password [Return]</td>

<td>PSWD2&gt;</td>
</tr>
<tr>
<td>PSWD2&gt; new_password [Return]</td>
<td>&gt;&gt;&gt;</td>
</tr>
</tbody>
</table>

If the two passwords you entered match, your password is changed.

If You Make an Error

If the two passwords you enter do not match, the console aborts the password command and displays the following error message:

```
? 34 ILL PSWD
```
Chapter Overview

Introduction
The alternate console feature of your system lets you direct console input and output from a monitor to another device, such as a terminal.

In This Chapter
This chapter covers the following topics:

• Before You Begin
• Using the Alternate Console Feature
Before You Begin

What You Should Know Beforehand

If you do not understand the alternate console feature, read the next section, Using the Alternate Console Feature, and then return to Table 11–1 to determine the status of your system and where to go next.

Using the Alternate Console Feature

When to Use an Alternate Console

The alternate console feature lets you direct console output to an output device such as a terminal or a printer. Possible reasons for using an alternate console are these:

- You cannot display output on your monitor because it is not working properly.
- You want to save a hard copy of screen display output. For example, when installing the OpenVMS AXP operating system, you can connect a printer to the alternate console port and direct screen output to that printer to create a printed copy of the installation screens.

Task Overview

Table 11–3 describes the steps to complete to use the alternate console feature.

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connect a terminal or printer.</td>
</tr>
<tr>
<td>2</td>
<td>Change the alternate console switch.</td>
</tr>
<tr>
<td>3</td>
<td>Redirect output to an alternate console if you started by displaying console output on a monitor.</td>
</tr>
</tbody>
</table>

The following sections describe these steps in detail.
Using the Alternate Console Feature

Step 1: Connect a Terminal or Printer

To connect a terminal or printer as an alternate console device, connect the terminal or printer cable to the alternate console/printer port on the system unit as shown in Figure 11–1.

Figure 11–1 Attaching a Device to the Alternate Console/Printer Port
Using the Alternate Console Feature

Step 2: Change the Alternate Console Switch

The alternate console switch on the rear of the system unit directs console output to one of two destinations: a monitor or an alternate console device, such as a terminal or a printer.

To direct console output to a console device, the alternate console switch should be set to the left as shown in Figure 11–2.

Figure 11–2 Changing the Alternate Console Switch
Using the Alternate Console Feature

**Step 3: Redirect Console Output**

If you were using a monitor to display console output before you connected an alternate console device, you must restart your system to redirect console output. (Restarting the system is sometimes referred to as power cycling the system.) If you do not restart your system, the console output will not display on the terminal or printer you connected.

**Restarting the System**

To change console output from the monitor to the alternate console, restart your system as follows:

1. Turn off your system unit by switching the power On/Off switch to the off (O) position. See Figure 6-1 for the location of the power switch.
2. Wait 10 to 15 seconds.
3. Turn on the system unit (by switching the power On/Off switch to the on (|) position).

**Look for Display**

Console output should now be displayed on the alternate console device.

Chapter Overview

Introduction

Though your DEC 3000 Model 500X AXP system is a high-quality, thoroughly tested product, it is also an electrical device that may exhibit problems on occasion. If you are experiencing problems with your system, this chapter will help you identify and possibly fix the problem.

In This Chapter

This chapter covers the following topics:

- Before You Begin
- Task Overview
- Determining Type of Problem
- Startup Problems
- Interpreting the show Command Display
- Display Problems
- Daily Operations Problems
- SCSI Device Problems
- Network Problems
- Where to Go Next
There are two ways to solve problems with the DEC 3000 Model 500X AXP system:

1. Use the chapters in Part III of this manual to help identify and possibly fix the problem yourself.

2. Contact your Digital service representative to diagnose and fix the problem for you.

Table 12–1 lists ways to identify problems, and indicates where each method is described:

<table>
<thead>
<tr>
<th>To identify a problem this way...</th>
<th>Refer to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the troubleshooting tables</td>
<td>This chapter</td>
</tr>
<tr>
<td>Run diagnostic tests</td>
<td>Chapter 13</td>
</tr>
</tbody>
</table>

Using the troubleshooting tables in this chapter is the easiest and most direct approach to identifying and correcting a problem with your DEC 3000 Model 500X AXP system. Therefore, this is the method with which you should begin.

The diagnostic tests described in Chapter 13 let you test specific devices and provide information on the source of your problem.
Table 12–2 describes the steps required to identify and possibly fix system problems.

<tr>

<td>Follow suggested actions to resolve problem.</td>
</tr>
<tr>
<td>4</td>
<td>If unable to resolve problem, see Chapter 13.</td>
</tr>
</tbody>
</table>

The next sections describe these steps.
Determining Type of Problem

The following sections describe various problems and their possible causes, as well as some corrective actions that you can take.

If you cannot isolate the problem, or if the corrective actions do not resolve the problem, see the section Reporting Problems to Digital Services.

Table 12-3 lists the problems described in the following sections.

Overview

There are many different causes of system startup problems. Locate the problem you are having in the following sections.

Power Indicator Light Off

If the power indicator light does not come on when you turn on your system, see Table 12-4. The indicator light is shown in Figure 12-1.

If the fan failure lights comes on, you will need to contact your Digital Services representative, as described in Chapter 13.

Whenever errors are detected, a line on the system startup display begins with two question marks, followed by a message.

Common Startup Errors

There are many reasons for startup errors. When you first install your system, one of the most common causes of startup errors is loose cable connections. Table 12–6 provides the device components likely to have loose connections.

If ? appears next to this component, check the appropriate cable or connector to make sure it is connected securely. Instructions on how to complete workstation connections are described in Chapter 3.

If the cables or connectors are not loose, or an error indicator appears next to other items in the Devnam column, refer to Chapter 13, which explains how to run diagnostic tests.
## Boot Failure

Interpreting the show Command Display

Overview

Your system includes various elements: components, memory modules, and optional devices. The show console commands test your system and display the status of these elements. Table 12–8 lists some of the show console commands and the information each provides:

Each of these commands is described in the following sections.

Error in show config Display

The show config command tests and displays information about system components and memory modules. The command also indicates whether errors were detected during the diagnostic test.
Figure 12–3 shows a `show config` command display that includes an error.

Interpreting the show Command Display

Elements in the show config Display

The `show config` command displays three columns of information described in Table 12-9.

<td>Status of system component or module.</td>
</tr>
</tbody>

Interpreting the show config Display

If no errors are detected when you enter a `show config` command, you will see the message OK next to each device name. If an error is detected for one or more system components, a question mark (?) error indicator will be displayed in the DEVSTAT column next to the corresponding device name.

If you see an error indicator next to any device name, as shown in Figure 12-3, note the error number and the DEVNAM on the Handling Problems worksheet at the end of Chapter 13. If you wish, you can test the device that shows an error in the show config display by following the instructions in Chapter 13.
Interpreting the show Command Display

The show device command provides a list of all installed devices on your system, including information about the type of device, its write/read capabilities, its capacity, and the device name.

Figure 12–4 shows an example of a show device command display.

While the show device display does not indicate the status of a device, it can be used for troubleshooting problems that may occur due to duplicate SCSI device ID numbers.

Interpreting the **show device** Display

The information presented in the `show device` display should correspond to the devices that are installed in your system. For instance, if you install a new drive in your system, that drive should be listed on the `show device` display after you complete the installation instructions. If you inadvertently used a SCSI ID number for the new drive that was already in use, the new drive would not be listed when you issue the `show device` command.

For more information about SCSI ID numbers, see the next section.

You can also use the `show device` command to determine device names when setting the `bootdef_dev` environment variable. Chapter 9 describes how to set and change environment variables.

Understanding SCSI ID Numbers

Your DEC 3000 Model 500X AXP system contains SCSI devices, and allows you to add SCSI devices. Each SCSI device has an ID number (from 0 to 7) that must be unique within your system.

A common error is to add a SCSI device with an ID number that is already being used by another device in your system. Since this error does not produce an error message, you must determine whether there are duplicate numbers yourself.

Do not set any of the SCSI device ID numbers to 7. This number is used for the SCSI controller on the system.

Determining Duplicate SCSI ID Numbers

To see whether two SCSI devices have the same ID number, perform the following steps:

1. Use the `show device` command to see which devices are installed in your system.
2. Record which SCSI ID number is assigned to each device.
3. See if the list of devices that your system displays matches the number of devices that are actually installed or attached to your system.

If the system list does not correspond with the number of devices actually installed, one of the devices may have a duplicate SCSI ID. If no SCSI ID numbers are duplicated, you will see the new device with a new SCSI ID number on the `show device` display.
The show error Command

The show error command displays specific information about any error that is occurring within your DEC 3000 Model 500X AXP system.

Table 12–11 lists the devices that the show error command provides information about.

For a complete list of FRU numbers and diagnostic test error numbers, see the DEC 3000 Model 500X AXP Service Documentation Kit.

Interpreting the show error Display

In addition to displaying an error message, the show error display also indicates test status messages, such as the message T-ERR-SCC-LK401 shown in Figure 12–5. Information about interpreting these messages is beyond the scope of this document. If you are contacting Digital Services, record the test status message(s) on the Handling Problems Worksheet at the end of Chapter 13.
The show memory command displays information about all of the memory in your system. This command lists a line of information about each memory bank. Note that the display will not indicate an error found in memory. You can only display memory errors using the show error or the test mem command. The test commands are described in Chapter 13.

Figure 12–6 shows an example of a show mem command display.

Figure 12–6 indicates that memory banks 0, 1, 2, and 3 each have 32 megabytes of memory. Memory banks 4, 5, 6, and 7 are not in use on this system.
Display Problems

Overview

If there appears to be some problem with your monitor display, try to locate the problem in this section.

Cursor in Corner of Screen

If your monitor displays diagnostic startup tests when you turn on your system, but then displays only the cursor in the lower left-hand corner of the screen (rather than displaying the system startup test information), the alternate console switch is in the wrong position.

Corrective Action

Locate the alternate console switch, on the rear of the system unit. Refer to Figure 11–2 to see the switch position. If the switch is set to the left, it is incorrect for a workstation. Complete these steps to change the switch position:

1. Turn off the system unit (power switch to the O position).
2. Move the alternate console switch to the right. Use a small pointed object to set the switch, but do not use a pencil; the graphite will damage the switch. See Chapter 11 for more information.
3. Turn on the system unit (power switch to the | position).
Distorted Display on Monitor

If your monitor is displaying information but appears distorted or unclear, see the possible causes in Table 12–13.

If you are having trouble with a SCSI device, such as an internal disk drive, or a tape drive in an expansion box, locate the problem in the next sections. For specific information about your SCSI device, refer to the documentation that was shipped with your system, or in the case of an option, with the option kit.

Internal Device Not Working

Where to Go Next

Determine Your Next Task

If you were unable to resolve your problem using the information in this chapter, contact Digital Services (instructions are provided in Chapter 13), or run system tests, also described in that chapter.
Chapter Overview

Introduction
This chapter contains information about running diagnostic tests and contacting Digital Services. Diagnostic tests can help you identify the specific part or module that is causing errors in your system.

In This Chapter
This chapter covers the following topics:

• Before You Begin
• Task Overview
• Running Diagnostic Tests
• Recording the Diagnostic Display Light Pattern
• Reporting Problems to Digital Services
• Handling Problems Worksheet
Before You Begin

Purpose of Tests

If you cannot locate and/or resolve the system problem using the troubleshooting tables in Chapter 12, you can run diagnostic tests. Diagnostic tests can help to identify the source of a problem and provide specific information to present to your Digital service representative over the telephone.

Your Digital service representative may also request that you run diagnostic tests.

What You Should Have Done Already

Before running diagnostic tests on your system to identify a defective component or module, you should have already completed these tasks:

- Put your DEC 3000 Model 500X AXP system in console mode. (See Chapter 6.)
- Tried to locate and resolve the problem with the information in Chapter 12.
- Used the `show` commands to determine the system component or device with an error. (See Chapter 12.)

If you have not completed any of these tasks, please refer to the relevant section in this guide.
Table 13–1 summarizes the steps to perform when running diagnostic tests in order to identify or resolve a system problem.

</tr>
<tr>
<td>4</td>
<td>Contact your Digital service representative.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

These steps are described in detail in the following sections.
Running Diagnostic Tests

If an error message is displayed next to a device name when you issue one of the `show` commands described in Chapter 12, you can test the device listed in the error message by using the `test` command.

Using this command, you can run a number of diagnostic tests to help you determine the status of a system module or device.

Table 13–2 provides a list of the available diagnostic tests and indicates whether the tests require a loopback connector. The tests are listed by the name of the device they test. Refer to Figure 3–2 to see how to connect the Ethernet loopback connector.

</tr>
</tbody>
</table>

¹Running ISDN diagnostic tests also tests the audio port
Using the test Command

Depending on the way you enter the `test` command, you can run a single test or multiple tests on a component.

Single Test Syntax

Use the following syntax to run a single test:

```plaintext
>>> test device_name
```

where `device_name` is one of the device names listed in Table 13–2.

Multiple Test Syntax

Use the following syntax to run multiple tests:

```plaintext
>>> test device_name1:device_name2
```

where `device_name1` is the device you want to start with, and `device_name2` is the last device you want to test. The diagnostic tests are run in the same order as the list of device name tests in Table 13–2.

Example Diagnostic Test

One diagnostic test is the SCC test, which tests the communication devices attached to your system unit, such as the keyboard and mouse. Figure 13–1 shows an example of an SCC test display.

**Figure 13–1  SCC Diagnostic Test Display**

```plaintext
>>> test scc
T-STS-SCC-OK
>>>```
Running Diagnostic Tests

Example Diagnostic Test with Error

If a diagnostic test fails, a display similar to the one shown in Figure 13–2 appears, containing information important to helping you determine the source of the problem.

Figure 13–2  SCC Test Display with Error

```plaintext
>>> test scc
? T-ERR-SCC-MOUSE - 0 char rcvd
?? 004   SCC 0x0060

  84 FAIL

>>> 
```

Understanding the test Command Display

In the previous example, the SCC test failed during testing of the mouse line. This means that the mouse is not being seen by the system. Check the mouse connector to make sure that it is properly connected to the mouse/keyboard connector. If it is properly seated, you may have a defective mouse. Contact your Digital service representative, as described in Chapter 12.

Initializing Your System

After you have run a test, you should use the following command to initialize your system to clear the error log from the system register. Figure 13–3 shows an example of the `init` command.
Running Diagnostic Tests

Figure 13–3 Initializing Your System

```plaintext
>>> init
INIT-S-CPU...
INIT-S-RESET_TC...
INIT-S-ASIC...
INIT-S-MEMO...
INIT-S-NVR...
INIT-S-CXT...
INIT-S-SCC...
INIT-S-NI...
INIT-S-SCSI...
INIT-S-ISDN...

>>> 
```

If the problem with your system has been fixed, after you initialize your system, you should be able to issue the `show config` command and not see any errors listed in the screen display.

**Note: Another Way to Initialize Your System**

You can also initialize your system after running diagnostic tests by running the same test again. If the problem has been fixed, the test, which failed before, will complete successfully.

Figure 13–4 shows a sample display of a successful SCC test.

Figure 13–4 Initializing the System with the SCC Test

```plaintext
>>> test scc
T-STS-SCC-OK

>>> 
```
Recording the Diagnostic Display Light Pattern

On the front of the system unit, there are two diagnostic display lights, as shown in Figure 13–5.

The diagnostic display lights can provide your Digital service representative with important information in determining the source of a problem.
Recording the Diagnostic Display Light Pattern

Understanding the Diagnostic Lights

During system startup, the diagnostic display lights flash on an array of different numbers and letters as the system startup tests are performed. The numbers on the display are not random. They represent the hexadecimal number of a test action or result.

For instance, when the startup tests are completed successfully and your system is in console mode, the diagnostic display lights display the hexadecimal code DD, as shown in Figure 13–6.

Figure 13–6  Console Mode Diagnostic Lights

MLO-010467

When your system is in program mode, the diagnostic display lights display the hexadecimal code 00.

When to Record the Diagnostic Display Lights

If a problem is detected during system startup or when you run diagnostic tests, you should record the diagnostic display light pattern on the appropriate section of the Handling Problems Worksheet at the end of this chapter.

Be sure to note when the display occurred, for instance, during startup or after entering the `show config` command.
Reporting Problems to Digital Services

How to Continue

If you are able to locate the source of the system problem, run a test, and initialize the system, but are still having problems with your DEC 3000 Model 500X AXP system, you should contact your Digital service representative.

Digital Support Centers

Digital service representatives are available at Digital support centers for on-site warranty and service contract customers. If you are not currently eligible to receive this support, but wish to, please contact either a Digital support center listed in Table 13–3, or your local Digital office.

How to Report Problems

If you are unable to locate the problem from the descriptions in the previous sections of this chapter, or the corrective actions suggested could not resolve the problem, you need to contact your Digital service representative. Before calling your Digital service representative to report a problem, complete these steps.

1. Write down the model and serial number of your system on the Handling Problems Worksheet at the end of this chapter.

Both of these numbers are located on a label on the front door of the system unit, as indicated in Figure 13–7. Your Digital service representative will need this information when you call.
2. Fill in the status checklist on the Handling Problems Worksheet at the end of this chapter.

3. Note the problem, possible causes if you know them, and solutions suggested in the previous sections. Also indicate what actions (if any) you have already taken to try to correct the problem.

4. Be prepared to read information from the screen and to enter commands at the keyboard while you talk to your Digital service representative on the telephone.
Digital Support Center Contact Numbers

Table 13–3 lists the telephone numbers for contacting a Digital service representative at your Digital support center.

If a Digital support center for your area is not listed below, please contact your local Digital office for assistance.

Installing Loopback Connectors

Your Digital service representative may ask you to install one or more of the following loopback connectors that were shipped with your system:

- 10BASE-T loopback connector
- Alternate console/printer port loopback connector
- Modem loopback connector

While your Digital service representative will provide verbal instructions, the following diagrams indicate where these loopback connectors should be attached to your system unit.
If your Digital service representative requests that you connect the 10BASE-T loopback connector, connect it as shown in Figure 13-8.

If your Digital service representative requests that you connect the alternate console/printer loopback connector, connect it as shown in Figure 13–9.

Appendix Overview

Introduction

This appendix is for users in the EEC who must attach nonshielded cables to their DEC 3000 Model 500X AXP system.

In This Appendix

This appendix covers:

- EEC Installation Instructions for Nonshielded Cables
EEC Installation Instructions for Nonshielded Cables

Compliance With EEC Regulations

In order to comply with radio interference regulations in the European Economic Community (EEC), shielded data cables must be used. To meet this requirement, users of nonshielded cables must ground the following ports, which use MMJ connectors, by using a pigtail ground wire:

- ISDN port (1 in Figure C–1)
- Alternate console/printer port (2 in Figure C–1)

Attaching the Pigtail Grounding Wire

To attach the pigtail grounding wire, complete the following steps and refer to Figure C–1.

1. Unscrew a TURBOchannel slot screw nearest to the port you are grounding.

2. Align the hook of the pigtail grounding wire with the screw hole.

3. Tighten the screw of the TURBOchannel slot until the grounding wire is secure.

Module Isolation

Clearance and Creepage Defined

Clearance and creepage distances must be maintained on your 54-21147 module. Clearance is the shortest distance in air between two points. Creepage is the shortest distance along a continuous surface between those same two points.

Creepage distances apply when the 54-21147 module system is installed in a controlled environment. You can check creepage distances by measuring the distance between adjacent parts.

If in doubt, you should seek the advice of a telecommunications safety engineer. Failure to install the 54-21147 module in accordance with these instructions will invalidate the approval.

Clearance and Creepage Distances

Except at the connector that plugs into the host, clearance and creepage distances of Xmm and Ymm, as listed in Table E–3, must be maintained between the approved module and other parts of the host, including expansion cards. Digital has ensured that when the 54-21147 module is installed within the DEC 3000 Model 500X AXP system, the creepage and clearance distances to the host are met.

Safety Warnings for UK Installations Only

Safety Labels on Ports

Ports indicated by the safety warning label do not provide sufficient isolation to satisfy the requirements of the relevant parts of standard BS6301. Therefore, any product connected to this port must meet one of the following conditions:

- Be covered by OFTEL’s General Approval NS/G/1234/J/100003  
  (All products supplied by Digital comply with this General Approval.)
- Have been approved to the relevant parts of standard BS6301
- Have previously been evaluated against British Telecom (Post Office) Technical Guide 2 or 26 and given permission to attach

Any other use of this product invalidates approval.
CAUTION: Hazardous Conditions on the Network

If a port has the following label, direct or indirect interconnection of that port, whether the port is marked or not, may produce hazardous conditions on the network:

SAFETY WARNING - See Instructions for Use Before Making Any Connection to This Module

Applicable Ports for Safety Label

The "SAFETY WARNING" label applies to all ports shown by callouts 1 through 13 in Figure E–1.

Figure E–1  Front View
