Preface

This document describes the installation and operation of the TZK11 Tape Backup System.

Document Organization

This manual is comprised of the following chapters:

• Chapter 1, Introduction—Provides an introduction to TZK11 Tape Backup System. Also provides information about the operational environment of TZK11 Tape Backup System.

• Chapter 2, Installing a SCSI Interface Unit—Provides information on installing a TZK11 Tape Backup System on a PC. Also provides information on getting started.

• Chapter 3, Operating Procedures—Addresses operating procedures, controls and indicators, tape cartridge handling, and jumper settings used with TZK11 Tape Backup System.

• Chapter 4, Operating System Support—Addresses operating system support and compatibility.

• Chapter 5, Preventive Maintenance and Problem Resolution—Describes preventive maintenance and diagnostics.

• Appendix A—Contains information on related supplies for the TZK11 Tape Backup System.

• Appendix B—Contains specifications for the TZK11 Tape Backup System.
## Conventions

The following table lists the conventions used in this manual.

<table>
<thead>

</table>
Introduction

The TZK11 Data Cartridge Tape Drive is a half-height, 5-¼ inch, Quarter-Inch Cartridge (QIC) streaming tape drive for use with PC, low-end, desktop, and Digital Equipment Corporation workstation systems. The TZK11 Data Cartridge Tape Drive provides archival storage/retrieval and data collection activities. The TZK11 Data Cartridge Tape Drive is Small Computer System Interface (SCSI-2) compliant.

The TZK11 Data Cartridge Tape Drive consists of one main component: the tape drive. The controller logic is located within the TZK11 Data Cartridge Tape Drive itself.

1.1 Operating System Support

TZK11 is configurable to work with either Digital operating systems (VAX/VMS, OpenVMS, DEC OSF/1, Windows NT (AXP)) or non-Digital operating systems (DOS/Windows, OS/2, SCO UNIX, Windows NT, Novell Netware, etc.) via a jumper on an Embedded unit or a micro switch on a Table Top unit.

1.2 TZK11 Models

The TZK11 tape drive is available as:

• Model TZK11-AA (Embedded) (See Figure 1–1 and Figure 1–2.)
• Model TZK11-DA (Table Top) (See Figure 1–3.)

Installing a SCSI Interface Unit

2.1 Preparing to Install

Before installing the SCSI Interface Unit, take the following steps:

1. Ensure that you have all the parts needed for your tape system.
2. Unplug the power cords from your computer and all system units.

_________________________ WARNING __________________________

Failure to remove power to the computer and all attached devices before removing the cover of the computer case could cause exposure to high voltages and increase the possibility of damaging peripheral equipment in the event of an accidental short circuit. This installation should be performed by a qualified technician.

_________________________ WARNING __________________________

3. Remove the computer cover.

Prior to handling any circuit boards, practice proper electrostatic discharge techniques by wearing a ground strap or by touching a metal part of plugged-in appliance that uses a three-prong plug. Failure to discharge static electricity can damage integrated circuits.

2.2 Configuring and Installing the Host Adapter Boards

This section provides instructions for configuring and installing AT/ISA, EISA, and MCA Host Adapter Boards.
2.2 Configuring and Installing the Host Adapter Boards

2.2.1 AT/ISA Host Adapter Boards

This section addresses configuring and installing the following AT/ISA Host Adapter Boards:

- ADAPTEC AHA1540
- V570
- ADAPTEC AHA1510

2.2.1.1 Configuring AT/ISA Host Adapter Boards

2.2.1.1.1 ADAPTEC AHA1540

Figure 2–1 shows the AHA1540 SCSI-interface Host Adapter Board which has parallel internal and external connectors for use in either internal or external systems.

Figure 2–1 The AHA1540 Host Adapter Board

Before you install the Host Adapter Board in your computer (see Section 2.2.1.2), you must preset the hardware configuration of the board. Make sure that the chosen configuration is not in conflict with other set-ups in your system.
2.2 Configuring and Installing the Host Adapter Boards

Default Settings
The AHA1540 Host Adapter supports the following default settings:

- **I/O Address**: 330H
- **Interrupt No.**: 11
- **DMA Channel**: 5
- **SCSI Device ID**: 7
- **BIOS Address**: DC000H
- **DMA Transfer Rate**: 5 MB/s

Alternative Jumper Settings
Figure 2–2 shows the Alternative Jumper Settings key which is used on all jumper fields. Figure 2–3 through Figure 2–6 show the Jumper Fields J5, J6, J7, and J9.

**Figure 2–2 Alternative Jumper Settings**

**Note**

The DMA channel must be the same for both the DMA Request and Acknowledge signals.
2.2 Configuring and Installing the Host Adapter Boards

2.2.1.2 V570 Figure 2–7 shows the V570 SCSI-interface Host Adapter Board, which has parallel internal and external connectors for use in either internal or external systems.

Before you install the Host Adapter Board in your computer (see Section 2.2.1.2), you must preset the hardware configuration of the board. Make sure that the chosen configuration is not in conflict with other set-ups in your system.

The hardware set-up includes the I/O address, the interrupt number, and the DMA channel. The plinths on the Host Adapter Board are used for this purpose.

**Figure 2–7 The V570 Host Adapter Board**

*Diagram showing configuration options*

**Default Settings**

The V570 Host Adapter supports the following default settings:

- I/O Address 360H
- Interrupt No. 5
- DMA Channel 6
**Alternative Settings**

Figure 2–8 shows how to set the jumpers; Figure 2–9 is an example of a setting.

**Figure 2–8  Jumper Setting Guidelines**

2.2.1.2 Installing AT/ISA Host Adapter Boards

To install the Host Adapter Board, take the following steps:

1. Select the expansion slot you wish to use. Any 16-bit empty slot will work.

2. Remove the rear panel slot cover for the expansion slot you will use. The cover is held in place by a single screw. Save the screw to attach the adapter board after it is plugged into the expansion slot.

3. Plug the adapter board into the slot and secure it with the screw that you saved after removing the slot cover.

4. If you are installing an external tape unit, you may now replace the cover on your computer case. Be careful not to snag or pinch any wires or cables. Proceed to Section 2.2.5, Installing an External Tape System.

5. If you are installing an internal unit, leave the computer cover off and proceed to Section 2.2.4, Installing the Internal Tape Unit.
2.2 Configuring and Installing the Host Adapter Boards

2.2.2 EISA Host Adapter Boards

This section describes how to configure and install an EISA host adapter.

2.2.2.1 Configuring the EISA Host Adapter Board

Figure 2-12 shows the AHA1740 SCSI-interface Host Adapter Board, which has parallel internal and external connectors for use in either internal or external systems.

The AHA1740 SCSI board requires no manual configuration to operate correctly in all situations.

After installing the board and the tape system, boot up your system with a copy of the bootable configuration diskette and start the EISA configuration program. It will auto-configure the system.

__________________________ Note __________________________

Always make a copy of your configuring diskette!

The configuration file for the AHA1740 board is called:

!ADP0000.CFG

If you are using the AHA1740 for the tape drive only (with no hard disk connected), disable the host adapter BIOS from the configuration program.
Installing a SCSI Interface Unit

2.2 Configuring and Installing the Host Adapter Boards

Figure 2–12 The AHA1740 Host Adapter Board

2.2.2.2 Installing the EISA Host Adapter Board

To install the EISA Host Adapter Board, take the following steps:

1. Select the expansion slot you wish to use.

2. Remove the rear panel slot cover for the expansion slot you will use. The cover is held in place by a single screw. Save the screw to attach the adapter board after it is plugged into the expansion slot.

3. Plug the adapter board into the slot and secure it with the screw that you saved after removing the slot cover.

4. If you are installing an external tape unit, you may now replace the cover on your computer case. Be careful not to snag or pinch any wires or cables. Proceed to Section 2.2.5, Installing an External Tape System.

5. If you are installing an internal unit, leave the computer cover off and proceed to Section 2.2.4, Installing the Internal Tape Unit.
2.2 Configuring and Installing the Host Adapter Boards

2.2.3 MCA Host Adapater Boards

This section describes how to configure and install an MCA Host Adapter Board.

2.2.3.1 Configuring the MCA Host Adapter Board

The AHA1640 Host Adapter Board (shown in Figure 2–13) and the IBM MCA-SCSI Host Adapter Board (shown in Figure 2–14) are both configured via software and, therefore, require no manual hardware configuration.

After installing the board and the tape system, start up the PS/2 from your copy of the configuring diskette and follow the instructions displayed on the screen to achieve a proper, automatic system configuration.

Note Always make a copy of your configuring diskette!

Figure 2–13 The AHA1640 Host Adapter Board
2.2 Configuring and Installing the Host Adapter Boards

2.2.3.2 Installing the MCA Host Adapter Board

To install the Host Adapter Board, take the following steps:

--- WARNING ---
Exposure to hazardous voltages may occur! Refer installation to qualified personnel only. Before you begin installation, position the system unit and any external option power switches to Off, then unplug the system unit and all other options from the wall outlet.

---

1. Follow steps 1 through 4 of Section 2.1, Preparing to Install.
2. Select an empty slot in the system unit.
3. Remove the cover in front of the empty slot before installing the Host Adapter Board. Loosen the screw and lift out the cover. (Keep cover for later use.)
4. Insert the Host Adapter Board by pressing it firmly into the connector of the empty slot. It will snap into place. Fasten the screw.
5. If you are installing an external tape unit, you may now replace the cover on your computer case. Be careful not to snag or pinch any wires or cables. Proceed to Section 2.2.5.
2.2 Configuring and Installing the Host Adapter Boards

2.2.4 Installing the Internal Tape Unit

To install the Internal Tape Unit, take the following steps:

1. Examine the space that you intend to mount the drive. If the design of your computer case incorporates slide tracks for rails on the sides of mounted devices, attach the plastic rails provided with your system to the sides of the tape unit. Select the proper size screws for your tape unit.

2. The internal drive unit left the factory strapped as Drive 5. If there is a Device ID conflict in your system, you must add or remove jumpers to the jumper block on the back of the unit to reorganize some other drive address (1 through 7). See Figure 2–15 and Figure 2–16 for details.

Note

If you are using the V570 Host Adapter Board, set the drive SCSI ID to 2.

---

Installing a SCSI Interface Unit

2–17
2.2 Configuring and Installing the Host Adapter Boards

Figure 2-15  Internal Device ID (Drive No.) Jumpering

- Drive=0 (no jumpers)
- Drive=1
- Drive=2 (default)
- Drive=3
- Drive=4
- Drive=5
- Drive=6
- Drive=7

Jumper Block

TZK11 (TDC 4220)
3. Slide the tape into the computer case to make sure there are no obstructions. Nothing should be forced. If rail mounting does not work, examine how the disk drives have been mounted in your computer and determine a way to mount the drive. There are too many different case designs on the market to be able to give exact mounting instructions.

Note: Depending on the final location of your tape drive, you may find it easier to plug the flat cable into the tape drive (see step 5 for cable connector orientation) before you mount the drive in the computer. Thread the cable into the mounting area first and route it toward the adapter board. Gently guide the cable as you push the drive into place. Be careful; Ribbon cables are delicate!

4. Before you mount the tape drive in the computer chassis, check to see that you will be able to plug the DC power cable into the unit easily.

5. Mount the tape unit to the computer chassis appropriately and plug the DC power cable in the drives power connector. See Figure 2–16. The mating connector is keyed so it will only go together one way.

6. If you have not already done so, connect the flat ribbon cable to the unit.

7. Route the other end of the flat ribbon cable over to the adapter board and plug it into the board connector.

Note: The connectors are keyed to prevent incorrect connections.

8. Replace the computer case cover, being careful not to snag or pinch any cables. Plug the computer and peripherals back into their wall sockets.
2.2.5 Installing an External Tape System

To install an external tape system, do the following.

1. Be sure you have followed steps 1 through 4 of Section 2.1.

2. Connect the round cable from the external tape unit cabinet to the Host Adapter Board connector (which is accessible from the rear panel of your computer). Connect the other end of the cable to the SCSI interface connector on the back of the tape unit. See Figure 2–16.

3. Make sure the thumbwheel rotary switch on the back of the tape unit matches the SCSI ID or the system. If it does not, press either one of the two tabs (above and below switch dial) to advance the switch.

   Note

   If you are using the V570 Host Adapter, set the drive SCSI ID to 2.

4. Set the VSEL switch to the PC position.
5. Plug the line cords for the computer, all peripherals, and the tape cabinet into wall sockets.

Note

For 230 V applications, this product employs a single fuse and a single-pole switch. It requires an additional two-pole disconnect device when the neutral in the mains supply cannot be identified.
The socket outlet must be installed near the equipment and must be easily accessible.
This chapter provides operating instructions for the TZK11 cartridge tape drive.

### 3.1 Controls and Indicators

The TZK11 cartridge tape drive, shown in Figure 3–1, has one dual-color (green and amber) LED and an eject button.

**Figure 3–1  TZK11 Tape Drive (Front View)**

3.1.2 Eject Button

The eject button unlocks the door and partially ejects the tape cartridge from the drive.

3.2 Tape Cartridge

The TZK11 Data Cartridge Tape Drive is shipped with a TZK1X-CE (QIC 2.0GB, Magnus 2.0) Tape Cartridge (shown in Figure 3–2), however, the TZK11 can be used with other standard format cartridges. See Table 3–2.
The tape cartridge has a write-protect switch to prevent accidental overwrite of data. When the switch is rotated to Safe, (Figure 3–3), data cannot be written to the tape.

The TZK1X-CE Tape Cartridge contains approximately 950 feet of magnetic tape wound on two reels. This tape cartridge has a formatted capacity of up to 2 Gigabytes of data.

The TZK11 Data Cartridge Tape Drive reads and writes according to the following table, however the density selection and ability to write lower densities on higher density tape is operating system dependent (see Table 3–3 and Chapter 4).

3.3 Using the Tape Cartridge

This section explains how to insert a tape cartridge into, and remove a tape cartridge from, the TZK11 drive and how to write protect a tape. This section also explains proper tape cartridge handling.

3.3.1 Tape Cartridge Handling

Take the following measures to prevent damage to your tape cartridge and to ensure continued tape drive reliability:

- Avoid dropping or banging cartridge.
- Keep cartridge out of direct sunlight and away from heaters and other sources of heat.
- Store cartridge where the temperature is between 10 and 40°C (50 to 104°F).
- After exposure to extreme heat or cold, allow the cartridge to stabilize at room temperature for the same amount of time it was exposed—up to 24 hours.
- Avoid placing cartridge near sources of electromagnetic interference, such as terminals, motors, and video or X-ray equipment. Any tape exposed to a magnetic field can lose information.
- Store cartridge in a dust-free environment where the relative humidity is between 20 to 80 percent.
- Store cartridge in its protective container, on edge or stacked. However, when stacking cartridges, do not stack more than five high.
- Place an identification label only in the space provided for the label on the top of cartridge.

3.3.2 Setting the Write-Protect Switch

Observe the following guidelines when setting the write-protect switch. See Figure 3–3.

- If you are reading data or copying data from a tape, set the write-protect switch to Safe (write protected).
- If you are writing data, set the write-protect switch to the write-permit position.
Operating Procedures
3.3 Using the Tape Cartridge

Figure 3–3 Setting the Write-Protect Switch

![Write-Permit Position](SAFE)

![Write-Protect Position](SAFE)

3.3.3 Inserting the Tape Cartridge into the Drive

Open the drive door by pressing the eject button. Insert the tape cartridge into the drive with the cartridge’s write-protect switch in the upper right corner (see Figure 3–4.) Slide the cartridge straight into the cartridge area until you feel resistance. Then, close the cartridge door.

When the tape is properly inserted, the LED will be solid green and you can issue host operating system commands.

Figure 3–4 Inserting the Tape Cartridge
3.3.4 Removing the Tape Cartridge from the Drive

After the tape is dismounted via software, the LED changes from blinking green to either solid green or off, and you can remove the tape from the drive.

Press the eject button. The door will open and the cartridge will eject part way. Pull down on the cartridge door, grasp the cartridge, and slide it out of the drive.

3.3.5 Retensioning

For satisfactory performance we recommend that the cartridge be retensioned (running the tape one complete end-to-end pass) in any of the following cases:

• Each time it is inserted in the drive
• After prolonged operation over a limited area
• After exposure to a temperature change greater than 30°F (16°C)
• After one hour of start-stop or shuffle operation

The retension function is supported for the TZK10/TZK11 tape drives only. The retension command may be different for other operating systems or tape utilities. Please refer to the appropriate system documentation.

3.3.5.1 VAX/VMS and OpenVMS

Retension the tape by performing the following VMS/OpenVMS commands:

1. Mount the drive /FOREIGN
   For example: $ MOUNT/FOREIGN MKA500

2. Issue one of the following commands:
   • SET MAGTAPE/REWIND/RETENSION
     Rewinds tape to BOT after a retension is performed.
   • SET MAGTAPE/UNLOAD/RETENSION
     The tape will be left "unloaded," not dismounted.
   For example: $ SET MAGTAPE/REWIND/RETENSION MKA500

Note

Retension for the TZK11 is not supported in VAX/VMS 5.5-2. However, support for the command is planned for subsequent releases.
Operating Procedures
3.3 Using the Tape Cartridge

3.3.5.2 DEC OSF/1
Retension the tape by performing the following DEC OSF/1 command:

```
mt -f /dev/rmt\nh ret
```
where $n$ equals the drive unit number.

3.3.5.3 SCO UNIX
Retension the tape by typing the following SCO UNIX command:

```
$ tape reten
```

3.4 Jumper/Switch Settings
This section shows how TZK11 tape drive is configured via jumpers (Embedded unit) or switch (Table Top unit).

3.4.1 SCSI ID Settings
This section shows how each Small Computer Systems Interface (SCSI) device's ID is determined and set. TZK11 tape drives are preset to the appropriate SCSI ID for the system during manufacturing. The SCSI IDs only have to be changed when a TZK11 tape drive is installed as an add-on to a system.

Note
Each SCSI device must have a unique SCSI ID.

The SCSI ID for the TZK11 Embedded unit is set or changed by adding jumpers to, or removing jumpers from, a connector at the rear of the tape drive. This connector is illustrated in Figure 3-5.

The TZK11 Table Top unit is set or changed by micro switch on the rear of the unit. See Figure 3-6. Each ID is represented by decimal digit. The valid SCSI ID is 0-7.

Table 3-4 lists the jumper settings necessary to configure the TZK11 tape drive for a particular SCSI ID.

3.4.2 Vendor/Product ID Select and Terminator Power

On the TZK 11 Embedded unit, the Vendor/Product ID Select and Terminator Power are set or changed by installing jumpers to, or removing jumpers from, the connector illustrated in Figure 3–5.

The default setting for the Vendor/Product ID Select (VSEL) jumper is TZK 11. For the Terminator Power (TERMPWR) jumper, the default is Enable. When the unit is installed in a system with a non-Digital operating system, the VSEL jumper should be removed.

On the TZK 11 Table Top unit, the Vendor/Product ID Select is set via the micro switch on the rear of the unit that is shown in Figure 3–6. The Terminator Power is set as the default and is not selectable without removing the Table Top enclosure.

The default setting for the Vendor/Product ID Select (VSEL) switch is to the Digital position, which configures the unit to be a TZK 11. When the unit is installed in a system with a non-Digital operating system, the VSEL switch should be set to the PC position.

_________________________ Note ________________________________

TZK 11 in PC position is equivalent to Tandberg TDC 4200/4220.

_________________________
4.1 TZK11 Operating Systems Support

The material in this chapter is for your reference. Because operating system commands are a complex tool, this chapter is not intended to teach you all the details involved in using such commands.

The TZK11 cartridge tape drive reads and writes tapes in many different densities and formats that are specified by the International Quarter-inch Cartridge (QIC) Standards Committee. The drive also supports an auto density selection feature that is used differently by different operating systems. This chapter describes the way different operating systems use the following features:

- The 512-bytes/1KB Block Sizes versus Variable Block Sizes
- Auto Density Selection in the Read case
- Density Selection in the Write case
- Vendor/Product ID Select

4.1.1 Digital Operating Systems Support

4.1.1.1 VAX/VMS and OpenVMS Support

The TZK11 cartridge tape drive is supported by VAX/VMS version 5.5-2 or higher, OpenVMS/VAX version 6.0 or higher, and OpenVMS/AXP version 1.5 or higher.

4.1.1.2 DEC OSF/1 Support

The TZK11 Data Cartridge Tape Drive is supported by DEC OSF/1 version 1.3 or higher.
Operating Systems Support
4.1 TZK11 Operating Systems Support

4.1.3 Windows NT (AXP) Support
The TZK11 Data Cartridge Tape Drive is supported by Windows NT (AXP) 3.1 or higher. Windows NT (AXP) supports TZK11 in PC mode.

4.1.2 Non-Digital Operating Systems Support
When configured as a PC device, the TZK11 cartridge tape drive will be equivalent to a TDC 4200/4220. It is supported by non-Digital operating systems, such as:

- MS–DOS/Windows, OS/2, Novell Netware, etc., when running from popular Backup Utilities such as SYTOS Plus, Conner Backup Exec Software, CorelSCSI, CPBackup, Norton Backup, Fastback, etc. (Check the correct version and device support list from listed Software Supplier’s literature.)
- Windows NT 3.1 supports NT Tape Backup Utility.
- SCO UNIX supports with UNIX Tape Archive Retrieval (TAR) Utility.

4.1.3 512-Byte Blocks, 1KB Blocks, and Variable Bytes Records
The QIC standards specify three formats for QIC-525/1GB/2GB cartridges. In all three cases the on-tape data format is 1K fixed blocks.

**512-byte fixed block**
The 512-byte fixed-block format takes two 512-byte user data blocks and writes one 1K block on tape. This format has the advantage that all other density QIC tapes are written in 512-byte blocks. Replacing older QIC tape drives with new density drives takes little or no operating system changes.

**1K fixed block**
This format is the native format for this density. User data is written directly as 1K data blocks.

**Variable-byte record tapes**
This format takes user data and creates one or more fixed-length blocks. The byte count is recorded in the first block and the last block is zero filled. In this way, the drive appears to read and write variable length records.

The following sections address the effects that the three formats have on operating systems.

4.1.3.1 VAX/VMS and OpenVMS
VAX/VMS and OpenVMS systems will only support the drive in variable block mode. This mode allows the drive to be used like any other VAX/VMS or OpenVMS tape drive.
Operating Systems Support

4.1 TZK11 Operating Systems Support

4.1.3.2 DEC OSF/1 Operating System
The DEC OSF/1 operating system will operate the TZK11 tape drive in both fixed-block 512-byte and variable block mode. Fixed-block mode is supported for QIC-120/150. Variable block mode is supported for QIC-320/525/1GB/2GB.

4.1.3.3 Windows NT (AXP) Support
Windows NT (AXP) supports TZK11 in fixed-block mode, which is the same as Windows NT native mode.

4.1.3.4 Non-Digital Operating Systems
Systems running OS/2, MS–DOS/Windows, Windows NT, and SCO UNIX support 512-byte or 1KB fixed block depends on backup utility.

4.1.4 Auto Density Select in the Read Case
The TZK11 tape drive performs automatic density selection when the tape drive is positioned at Beginning of Tape (BOT) and receives a read command. Because there are two formats of fixed-block operations, the drive can be set up in the factory to default to either format. The TZK11 is set to 512-byte block format.

4.1.5 Density Select in the Write Case
This feature allows the TZK11 tape drive to select the density the tape is written start from BOT. In default mode, TZK11 is auto density select the format and density of the inserted cartridge. The auto density select enabled the TZK11 to write the tape in the highest density supported by the current cartridge. When other density which different than default is selected, TZK11 will write the selected density on tape if the inserted cartridge supports the selected density. This feature is OS dependent.

4.1.6 Vendor/Product ID Select
This feature is controlled by a jumper and micro switch on the back of the embedded and table top drive respectively.

When the Vendor/Product ID Select (VSEL) jumper is installed or switch set to the Digital position, the drive will be a TZK11. This configuration is recommended for Digital operating systems.

When the Vendor/Product ID Select (VSEL) jumper is not installed or when the switch is set to the PC position, the drive will be a TDC 4200. This configuration is recommended for non-Digital operating systems.
Preventive Maintenance and Problem Resolution

This chapter describes preventive maintenance and problem solving for the TZK11 cartridge tape drive. Preventive maintenance involves periodic head cleaning. Problem solving is described in Section 5.3.

Digital Equipment Corporation strongly recommends that you follow the instructions for handling cartridge tapes, retensioning the cartridge tapes, and cleaning the heads of the drive.

5.1 Cleaning the Heads

The heads are the components in a drive that physically read and write data to and from the media (in this case, a cartridge tape).

Recommended equipment for head cleaning is Digital Cleaning Cartridge, part number TZK1X-HA. Refer to the tape head cleaning instructions included with the cleaning cartridge.

The cleaning interval depends on three main factors:

1. How often the drive is used
2. The quality of the tape
3. The quality of the environment

However, the following can be used as a recommended guideline: Clean the head after every 8 hours of use.

5.2 System-Based Diagnostics

Your system has system-based diagnostics that can be used to test the TZK11 tape drive.

System-based diagnostics are usually referred to in your system owner’s manual as console-based diagnostics, self-tests, or system exercisers. Refer to your system documentation for information about these diagnostics.
Preventive Maintenance and Problem Resolution

5.2 System-Based Diagnostics

Prior to calling Customer Services, you can execute system diagnostics to test the TZK11 drive. Always try cleaning the head and using a different cartridge before calling Customer Services.

NOTE

Some system-based diagnostics are subject to software licensing. Consult your Digital Equipment Corporation sales representative.

5.3 Tape Drive and Media Errors

If a drive error occurs during an operation, you may be able to clear the fault, rewind, unload, and remove the tape cartridge.

If the amber LED goes out when you remove the cartridge, the error is likely media related or due to a dirty head. Clean the head and try another cartridge.

If the amber LED stays on when you remove the cartridge, call your authorized Digital Equipment Corporation Customer Services representative.

5.4 Repair Services

Digital Equipment Customer Services offer a range of flexible service plans.

5.4.1 On-Site Service

On-Site Service offers the convenience of service at your site, and insurance against unplanned repair bills. For a small monthly fee, you receive personal service from our Customer Services Specialists. Within a few hours, the specialist is dispatched to your site with equipment and parts to give you fast and dependable maintenance.

5.4.2 Basic Service

Basic Service offers full coverage from 8 a.m. to 5 p.m., Monday through Friday. Options are available to extend your coverage to 12-, 16-, or 24-hour days, and to Saturdays, Sundays, and holidays. Under the basic service plan, all parts, materials, and labor are covered in full.
5.4 Repair Services

5.4.3 DECservice

DECservice offers a premium, on-site service providing committed response to remedial service requests made during contracted hours of coverage. Remedial maintenance will be performed continuously until the problem is resolved, which makes this service ideal for customers requiring maximum service performance. Under DECservice, all parts, materials, and labor are covered in full.

5.4.4 Carry-In Service

Carry-In Service offers fast, personalized response, and the ability to plan your maintenance costs for a smaller monthly fee than On-Site Service. When you bring your unit to one of 160 Digital SERVICenters worldwide, factory-trained personnel repair your unit within 2 days. This service is available on selected terminals and systems. Contact your local Digital Equipment Customer Services office to see if this service is available for your unit. Digital SERVICenters are open during normal business hours, Monday through Friday.

5.4.5 Per Call Service

Per Call Service offers a maintenance program on a noncontractual, time-and-materials-cost basis. It is appropriate for customers who have to perform first-line-maintenance, but may occasionally need in-depth support from Digital Equipment Customer Services.
To order additional blank cartridges and head cleaning cartridges, contact either your Digital Equipment sales representative or DECdirect™. Refer to the following part numbers.

(continued on next page)
### Power Requirements

- +12 V ± 5% @ 1.0 A (2.0 A surge),
  150 mV ripple peak-to-peak
- +5 V ± 5% @ 1.2 A (1.8 A surge),
  150 mV ripple peak-to-peak

### Power Consumption

- **Nominal:** 20 W
- **Peak:** 33 W

### Environmental

#### Operating
- **Temperature:** 5°C (50°F) to 40°C (104°F)
- **Humidity:** 20% to 80% RH maximum

#### Non-operating
- **Temperature:** -30°C (-22°F) to +60°C (151°F)
- **Humidity:** 10% to 90% RH maximum

#### Altitude
- **Operating:** 2.4 km (13,000 ft)
- **Non-operating:** 4.9 km (40,000 ft)
## Table B–2 Acoustic Noise Declaration for German Noise Declaration Labor:
Declared Values per ISO 9296 and ISO 7779

<table>
<thead>
<tr>
<th>Product</th>
<th>Sound Power Level $L_{WA,a}$, B</th>
<th>Sound Pressure Level $L_{PA,m}$, dBA (bystander positions)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Idle</td>
<td>Operate</td>
</tr>
<tr>
<td>TZK11-DA</td>
<td>5.0</td>
<td>5.9</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Product</th>
<th>Sound Power Level $L_{WA,a}$, B</th>
<th>Sound Pressure Level $L_{PA,m}$, dBA (operator position)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Idle</td>
<td>Operate</td>
</tr>
<tr>
<td>TZK11-AA</td>
<td>–</td>
<td>5.9</td>
</tr>
</tbody>
</table>

**Note**

Current values for specific configurations are available from Digital representatives. 1 B = 10 dBA.

## Table B–3 Schallemissionswerte - Werteangaben nach ISO 9296 und ISO 7779 /DIN EN27779:

<table>
<thead>
<tr>
<th>Gerät</th>
<th>Schalleistungspegel $L_{WA,a}$, B</th>
<th>Schalldruckpegel $L_{PA,m}$, dBA (Bediener position)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Leerlauf</td>
<td>Betrieb</td>
</tr>
<tr>
<td>TZK11-DA</td>
<td>5.0</td>
<td>5.9</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Product</th>
<th>Schalleistungspegel $L_{WA,a}$, B</th>
<th>Schalldruckpegel $L_{PA,m}$, dBA (Zuschauerpositionen)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Idle</td>
<td>Operate</td>
</tr>
<tr>
<td>TZK11-AA</td>
<td>–</td>
<td>5.9</td>
</tr>
</tbody>
</table>
Hinweis

Aktuelle Werte für spezielle Ausrüstungsstufen sind über die Digital Equipment Vertretungen erhältlich. $1 \text{ B} = 10 \text{ dBA}$.
